## NTE861 Integrated Circuit Quad, Normally Open, SPST JFET Analog Switch <sup>w</sup>/Disable

**Description:**

The NTE861 is a monolithic combination of bipolar and JFET technology producing a one chip quad JFET switch. A unique circuit technique is employed to maintain a constant resistance over the analog voltage range of  $\pm 10V$ . The input is designed to operate from minimum TTL levels, and switch operation also ensures a break-before-make action.

**Features:**

- Analog signals are not loaded
- Constant "ON" resistance for signals up to  $\pm 10V$  and 100kHz
- Pin compatible with CMOS switches with the advantage of blow out free handling
- Small signal analog signals to 50MHz
- Break-before-make action
- High open switch isolation at 1.0MHz
- Low leakage in "OFF" state
- TTL, DTL, RTL compatibility
- Single disable pin opens all switches in package

This device operates from a  $\pm 15V$  supply and swings a  $\pm 10V$  analog signal. The JFET switches are designed for applications where a dc to medium frequency analog signal needs to be controlled.

Note 4. This is the analog signal slew rate above which the signal is distorted as a result of finite internal slew rates.

Note 5. All switches in the device are turned "OFF" by saturating a transistor at the disable node. The delay times will be approximately equal to the  $t_{ON}$  or  $t_{OFF}$  plus the delay introduced by the external transistor.
