Chapter 5. The Discontinuous Conduction Mode

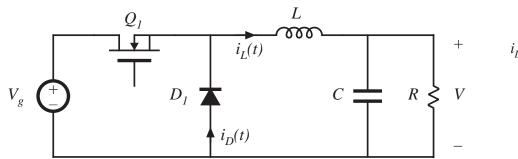

- 5.1. Origin of the discontinuous conduction mode, and mode boundary
- 5.2. Analysis of the conversion ratio M(D,K)
- 5.3. Boost converter example
- 5.4. Summary of results and key points

Introduction to Discontinuous Conduction Mode (DCM)

- Occurs because switching ripple in inductor current or capacitor voltage causes polarity of applied switch current or voltage to reverse, such that the current- or voltage-unidirectional assumptions made in realizing the switch are violated.
- Commonly occurs in dc-dc converters and rectifiers, having singlequadrant switches. May also occur in converters having two-quadrant switches.
- Typical example: dc-dc converter operating at light load (small load current). Sometimes, dc-dc converters and rectifiers are purposely designed to operate in DCM at all loads.
- Properties of converters change radically when DCM is entered:
 M becomes load-dependent
 Output impedance is increased
 Dynamics are altered
 - Control of output voltage may be lost when load is removed

5.1. Origin of the discontinuous conduction mode, and mode boundary

Buck converter example, with single-quadrant switches

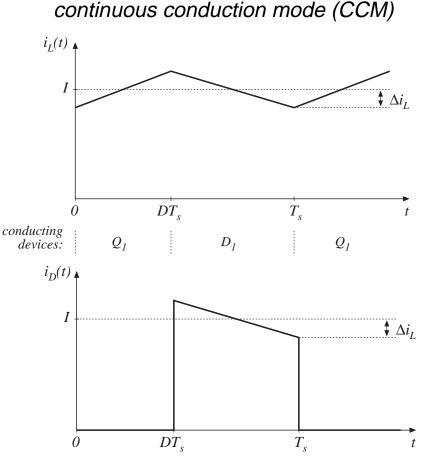

Minimum diode current is $(I - \Delta i_L)$ Dc component I = V/RCurrent ripple is

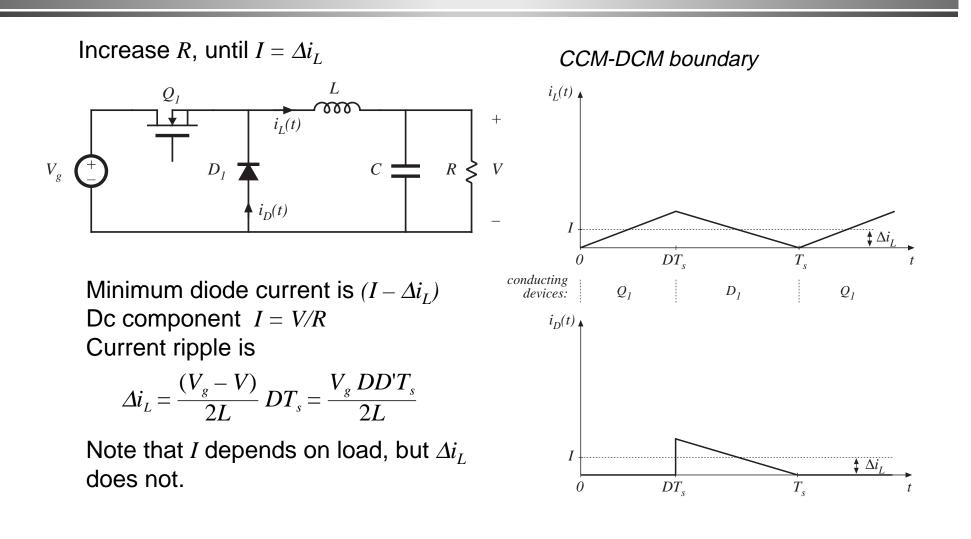

$$\Delta i_L = \frac{(V_g - V)}{2L} DT_s = \frac{V_g DD'T_s}{2L}$$

Note that *I* depends on load, but Δi_L does not.

Fundamentals of Power Electronics

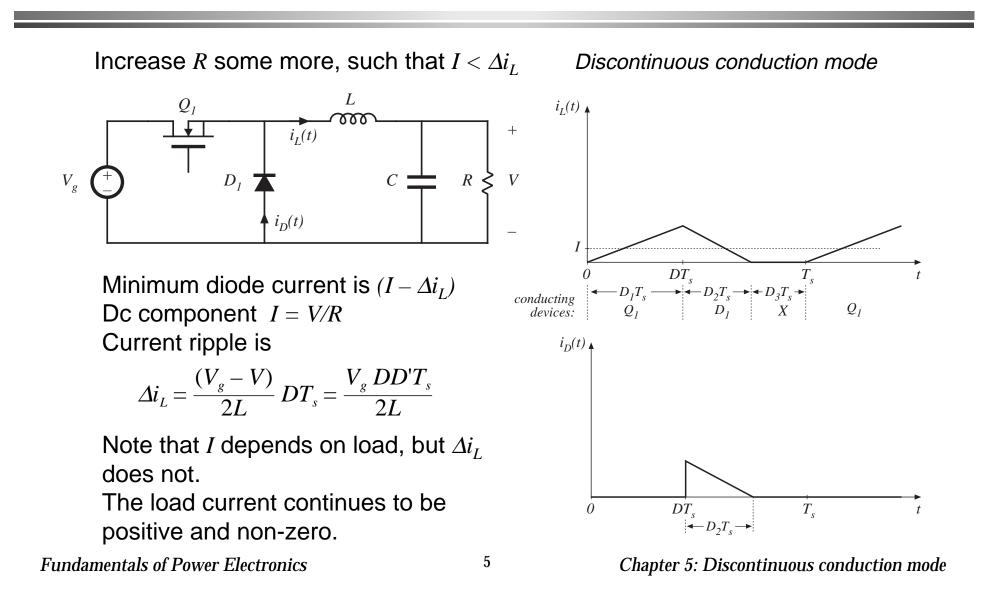

Reduction of load current

Fundamentals of Power Electronics

4

Further reduce load current

Mode boundary

 $I > \Delta i_L \quad for \ CCM$ $I < \Delta i_L \quad for \ DCM$

Insert buck converter expressions for *I* and Δi_L :

$$\frac{DV_g}{R} < \frac{DD'T_sV_g}{2L}$$

Simplify:

$$\frac{2L}{RT_s} < D'$$

This expression is of the form

$$K < K_{crit}(D) \quad for \ DCM$$

where $K = \frac{2L}{RT_s} \quad and \quad K_{crit}(D) = D^{T}$

Fundamentals of Power Electronics

K and K_{crit} vs. D

for *K* < 1: for *K* > 1: $K > K_{crit}$: CCM 2 $K < K_{crit}$: 2 $K > K_{crit}$: $K = 2L/RT_s$ DCM ССМ $\frac{K_{crit}(D)}{1-D} = 1-D$ $\frac{K_{crit}(D)}{1-D} = 1-D$ 1 1 $K = 2L/RT_s$ 0 0 D 0 D 0 1

7

Critical load resistance R_{crit}

Solve K_{crit} equation for load resistance *R*:

$$R < R_{crit}(D) \quad for \ CCM$$
$$R > R_{crit}(D) \quad for \ DCM$$
where
$$R_{crit}(D) = \frac{2L}{D'T_s}$$

Summary: mode boundary

$K > K_{crit}(D)$	or	$R < R_{crit}(D)$	for CCM
$K < K_{crit}(D)$	or	$R > R_{crit}(D)$	for DCM

Table 5.1. CCM-DCM mode boundaries for the buck, boost, and buck-boost converters

Converter	$K_{crit}(D)$	$\max_{0 \le D \le 1} (K_{crit})$	$R_{crit}(D)$	$\min_{0 \le D \le 1} (R_{crit})$
Buck	(1 - D)	1	$\frac{2L}{(1-D)T_s}$	$2 \frac{L}{T_s}$
Boost	$D (1 - D)^2$	$\frac{4}{27}$	$\frac{2L}{D\left(1-D\right)^2 T_s}$	$\frac{27}{2} \frac{L}{T_s}$
Buck-boost	$(1 - D)^2$	1	$\frac{2L}{\left(1-D\right)^2 T_{\rm s}}$	$2 \frac{L}{T_s}$

5.2. Analysis of the conversion ratio *M*(*D*,*K*)

Analysis techniques for the discontinuous conduction mode:

Inductor volt-second balance

$$\langle v_L \rangle = \frac{1}{T_s} \int_0^{T_s} v_L(t) dt = 0$$

Capacitor charge balance

$$\left\langle i_{C}\right\rangle = \frac{1}{T_{s}}\int_{0}^{T_{s}}i_{C}(t) dt = 0$$

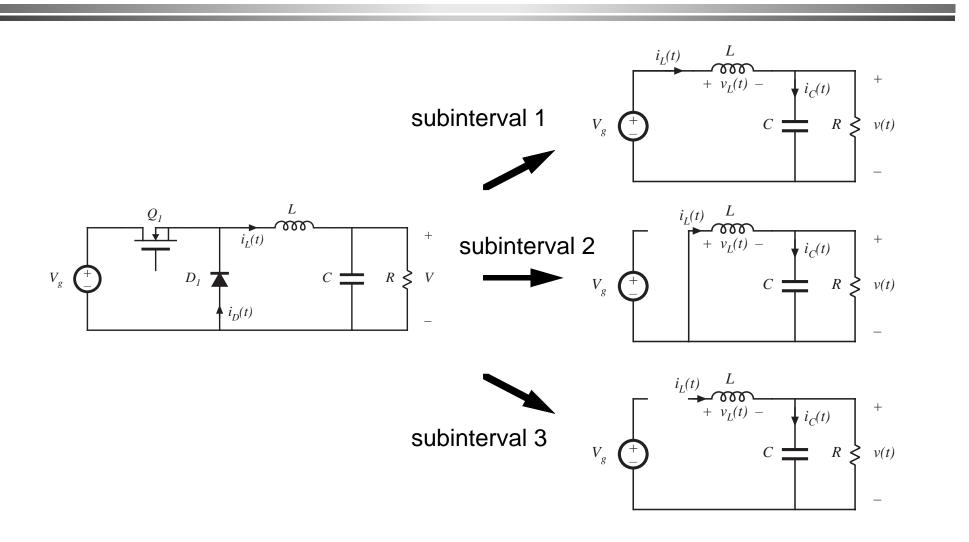

Small ripple approximation sometimes applies:

```
v(t) \approx V because \Delta v \ll V
```

```
i(t) \approx I is a poor approximation when \Delta i > I
```

Converter steady-state equations obtained via charge balance on each capacitor and volt-second balance on each inductor. Use care in applying small ripple approximation.

Example: Analysis of DCM buck converter *M*(*D*,*K*)

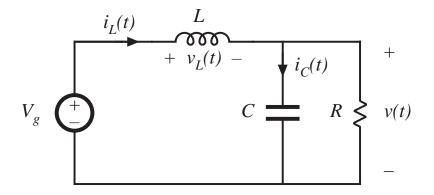

$$v_L(t) = V_g - v(t)$$
$$i_C(t) = i_L(t) - v(t) / R$$

Small ripple approximation for v(t) (but not for i(t)!):

$$v_L(t) \approx V_g - V$$

 $i_C(t) \approx i_L(t) - V / R$

 V_{g}

$$v_L(t) = -v(t)$$

$$i_C(t) = i_L(t) - v(t) / R$$

Small ripple approximation for v(t) but not for i(t):

of for
$$i(t)$$
:

$$i_C(t) \approx i_L(t) - V / R$$

 $v_L(t) \approx -$

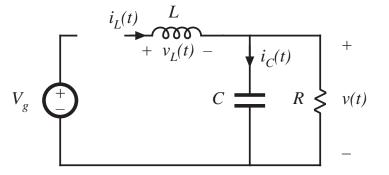

v(t)

$$v_L = 0, \quad i_L = 0$$

 $i_C(t) = i_L(t) - v(t) / R$

Small ripple approximation:

$$v_L(t) = 0$$
$$i_C(t) = -V / R$$

Inductor volt-second balance

Volt-second balance:

$$\langle v_L(t) \rangle = D_1(V_g - V) + D_2(-V) + D_3(0) = 0$$

Solve for *V*:

$$V = V_g \frac{D_1}{D_1 + D_2}$$

note that D_2 is unknown

Fundamentals of Power Electronics

15

Capacitor charge balance

node equation:

$$i_L(t) = i_C(t) + V / R$$

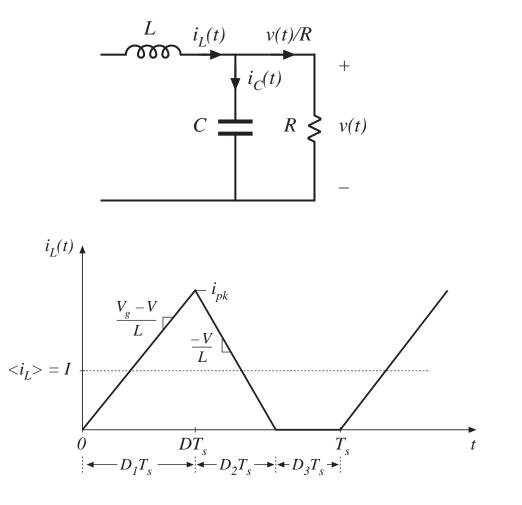

capacitor charge balance:

$$\langle i_C \rangle = 0$$

hence

$$\langle i_L \rangle = V / R$$

must compute dc component of inductor current and equate to load current (for this buck converter example)

Inductor current waveform

 $\frac{V_g - V}{L}$

 $-D_1T_s$

 $i_L(t)$

 $< i_L > = I$

peak current: $i_L(D_1T_s) = i_{pk} = \frac{V_g - V}{L} D_1T_s$ average current: $\langle i_L \rangle = \frac{1}{T_s} \int_0^{T_s} i_L(t) dt$

triangle area formula:

$$\int_0^{T_s} i_L(t) \, dt = \frac{1}{2} \, i_{pk} \, (D_1 + D_2) T_s$$

$$\left\langle i_L \right\rangle = \left(V_g - V \right) \frac{D_1 T_s}{2L} \left(D_1 + D_2 \right)$$

equate dc component to dc load current:

 $\overrightarrow{DT}_{s} \qquad T_{s}$

$$\frac{V}{R} = \frac{D_1 T_s}{2L} (D_1 + D_2) (V_g - V)$$

Solution for *V*

Two equations and two unknowns (V and D_2):

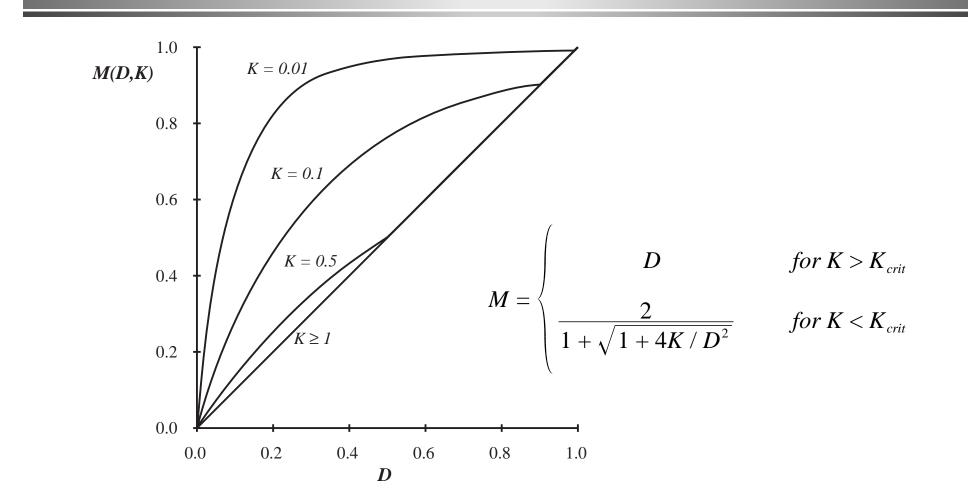

$$V = V_g \frac{D_1}{D_1 + D_2}$$
 (from inductor volt-second balance)
$$\frac{V}{R} = \frac{D_1 T_s}{2L} (D_1 + D_2) (V_g - V)$$
 (from capacitor charge balance)

Eliminate D_2 , solve for V:

$$\frac{V}{V_g} = \frac{2}{1 + \sqrt{1 + 4K / D_1^2}}$$

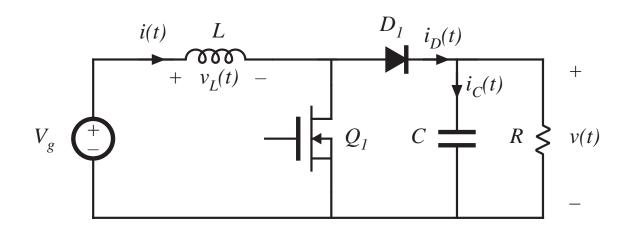

where $K = 2L / RT_s$
valid for $K < K_{crit}$

Buck converter M(D,K)

Fundamentals of Power Electronics

5.3. Boost converter example

Mode boundary:

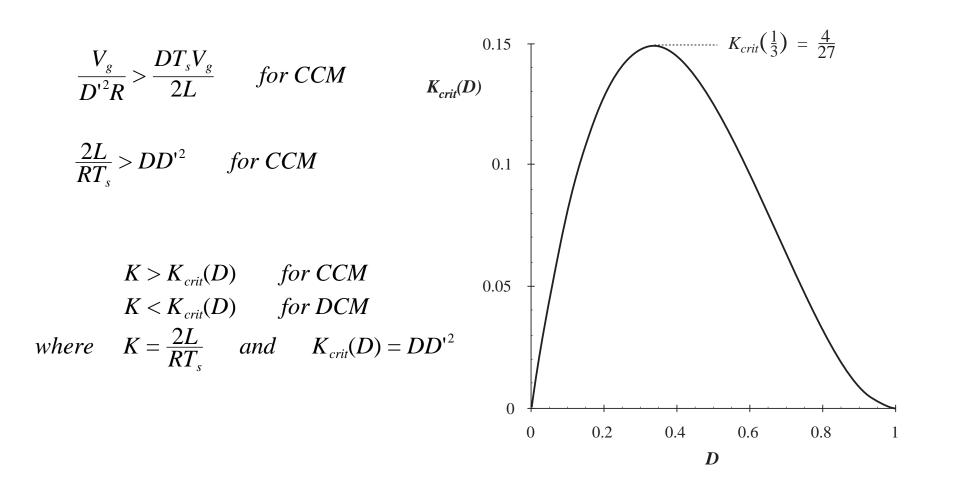

Previous CCM soln:

$$I > \Delta i_{L} \quad for \ CCM$$
$$I < \Delta i_{L} \quad for \ DCM$$

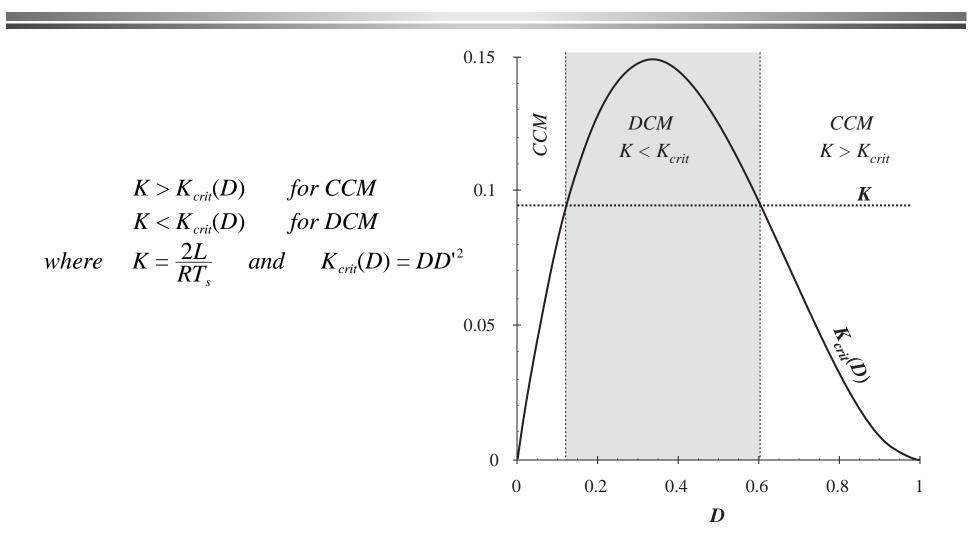

$$I = \frac{V_g}{D'^2 R} \qquad \Delta i_L = \frac{V_g}{2L} DT_s$$

Fundamentals of Power Electronics

Mode boundary

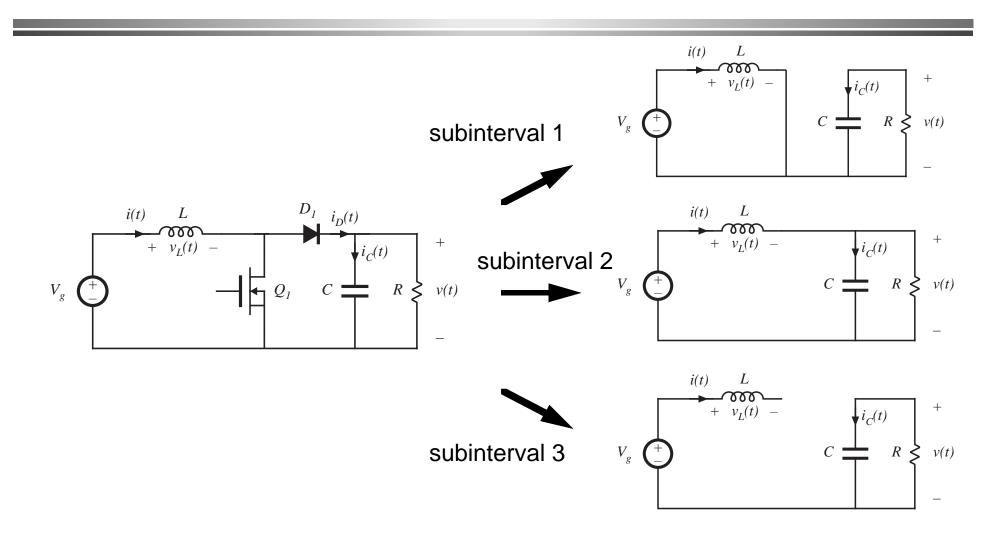

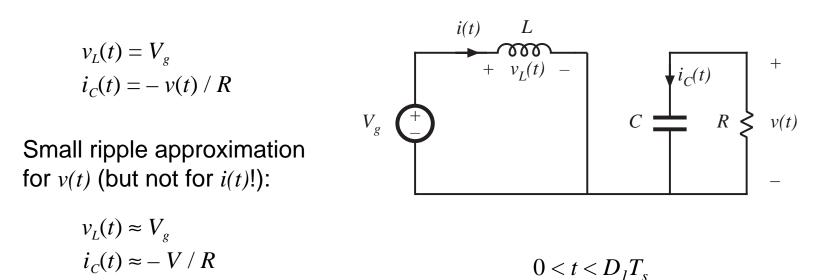

Mode boundary

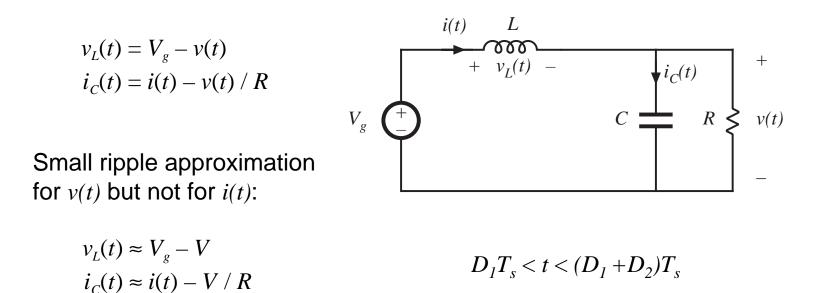

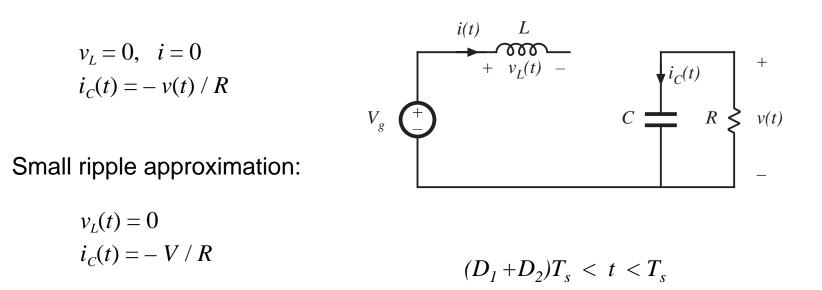

Fundamentals of Power Electronics

Conversion ratio: DCM boost

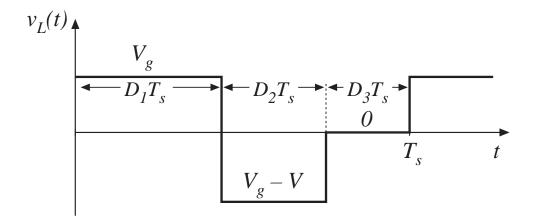

Inductor volt-second balance

Volt-second balance:

$$D_1 V_g + D_2 (V_g - V) + D_3 (0) = 0$$

Solve for *V*:

$$V = \frac{D_1 + D_2}{D_2} V_g$$

note that D_2 is unknown

Fundamentals of Power Electronics

Capacitor charge balance

node equation:

$$i_D(t) = i_C(t) + v(t) / R$$

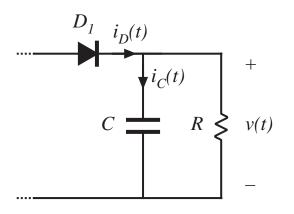

capacitor charge balance:

$$\langle i_C \rangle = 0$$

hence

$$\langle i_D \rangle = V / R$$

must compute dc component of diode current and equate to load current (for this boost converter example)

Inductor and diode current waveforms

peak current:

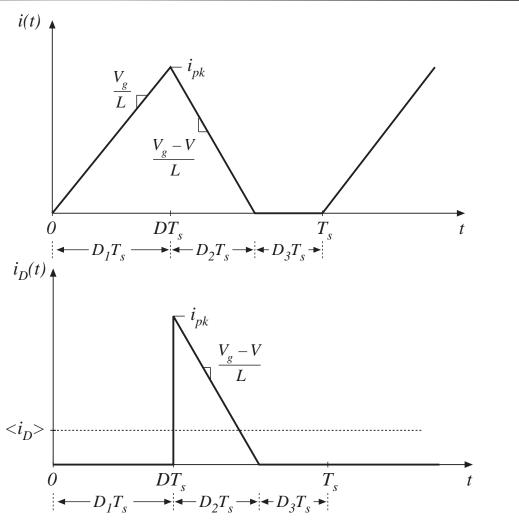

$$i_{pk} = \frac{V_g}{L} D_1 T_s$$

average diode current:

$$\left\langle i_D \right\rangle = \frac{1}{T_s} \int_0^{T_s} i_D(t) dt$$

triangle area formula:

$$\int_0^{T_s} i_D(t) \, dt = \frac{1}{2} \, i_{pk} \, D_2 T_s$$

Fundamentals of Power Electronics

Equate diode current to load current

average diode current:

$$\langle i_D \rangle = \frac{1}{T_s} \left(\frac{1}{2} i_{pk} D_2 T_s \right) = \frac{V_g D_1 D_2 T_s}{2L}$$

equate to dc load current:

$$\frac{V_g D_1 D_2 T_s}{2L} = \frac{V}{R}$$

Solution for *V*

Two equations and two unknowns (V and D_2):

$V = \frac{D_1 + D_2}{D_2} V_g$	(from inductor volt-second balance)	
$\frac{V_g D_1 D_2 T_s}{2L} = \frac{V}{R}$	(from capacitor charge balance)	

Eliminate D_2 , solve for V. From volt-sec balance eqn:

$$D_2 = D_1 \frac{V_g}{V - V_g}$$

Substitute into charge balance eqn, rearrange terms:

$$V^{2} - VV_{g} - \frac{V_{g}^{2}D_{1}^{2}}{K} = 0$$

Solution for *V*

$$V^2 - VV_g - \frac{V_g^2 D_1^2}{K} = 0$$

Use quadratic formula:

$$\frac{V}{V_g} = \frac{1 \pm \sqrt{1 + 4D_1^2 / K}}{2}$$

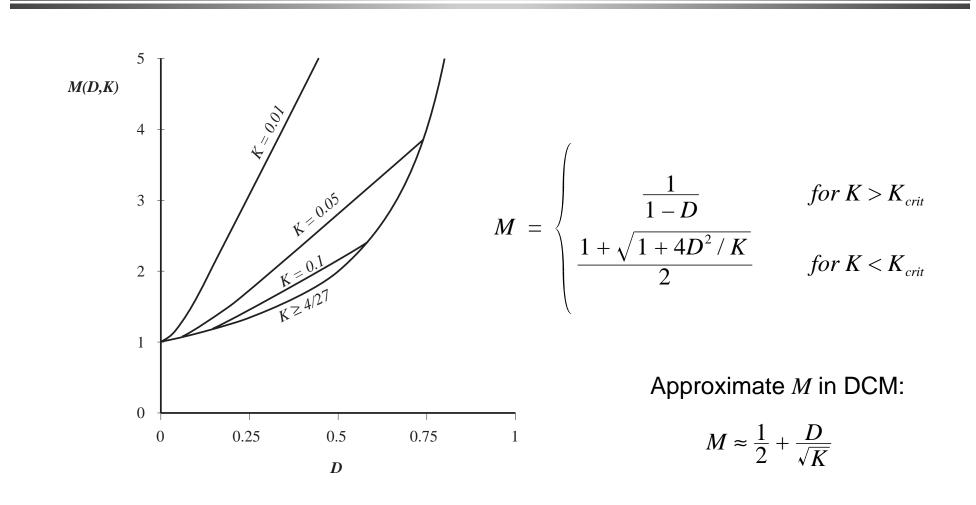

Note that one root leads to positive *V*, while other leads to negative *V*. Select positive root:

$$\frac{V}{V_g} = M(D_1, K) = \frac{1 + \sqrt{1 + 4D_1^2 / K}}{2}$$

where	$K = 2L / RT_s$
valid for	$K < K_{crit}(D)$

Transistor duty cycle D = interval 1 duty cycle D_1

Boost converter characteristics

Fundamentals of Power Electronics

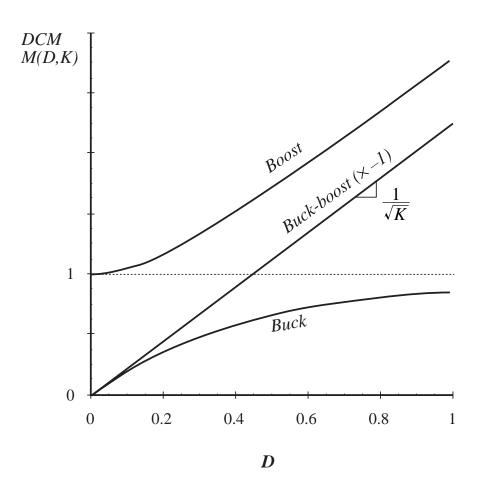

Summary of DCM characteristics

Table 5.2. Summary of CCM-DCM characteristics for the buck, boost, and buck-boost converters

Converter	$K_{crit}(D)$	DCM M(D,K)	$DCM D_2(D, K)$	CCM M(D)
Buck	(1 - D)	$\frac{2}{1+\sqrt{1+4K/D^2}}$	$\frac{K}{D}M(D,K)$	D
Boost	$D (1 - D)^2$	$\frac{1+\sqrt{1+4D^2/K}}{2}$	$\frac{K}{D}M(D,K)$	$\frac{1}{1-D}$
Buck-boost	$(1 - D)^2$	$-\frac{D}{\sqrt{K}}$	\sqrt{K}	$-\frac{D}{1-D}$

with $K = 2L / RT_s$. DCM occurs for $K < K_{crit}$.

Summary of DCM characteristics

- DCM buck and boost characteristics are asymptotic to M = 1 and to the DCM buck-boost characteristic
- DCM buck-boost characteristic is linear
- CCM and DCM characteristics intersect at mode boundary. Actual *M* follows characteristic having larger magnitude
- DCM boost characteristic is nearly linear

Summary of key points

- 1. The discontinuous conduction mode occurs in converters containing current- or voltage-unidirectional switches, when the inductor current or capacitor voltage ripple is large enough to cause the switch current or voltage to reverse polarity.
- 2. Conditions for operation in the discontinuous conduction mode can be found by determining when the inductor current or capacitor voltage ripples and dc components cause the switch on-state current or off-state voltage to reverse polarity.
- 3. The dc conversion ratio *M* of converters operating in the discontinuous conduction mode can be found by application of the principles of inductor volt-second and capacitor charge balance.

Summary of key points

- 4. Extra care is required when applying the small-ripple approximation. Some waveforms, such as the output voltage, should have small ripple which can be neglected. Other waveforms, such as one or more inductor currents, may have large ripple that cannot be ignored.
- 5. The characteristics of a converter changes significantly when the converter enters DCM. The output voltage becomes loaddependent, resulting in an increase in the converter output impedance.
