ICOM

SERVICE MANUAL

IC-μ4A/AT/E

430/440 MHz FM TRANSCEIVER

ICOM INCORPORATED

SCOPE OF THE SERVICE MANUAL

This service manual covers all service information related to the theoretical, physical, mechanical and electrical characteristics of the IC-μ4A/AT/E 430/440 MHz FM TRANSCEIVER.

IC-μ4A

IC-μ4AT

IC-μ4E

ASSISTANCE

If you require assistance or further information regarding the operation, capability and servicing of the IC-μ4A/AT/E, contact your nearest authorized ICOM Dealer or ICOM Service Center. Addresses are provided on the inside back cover for your convenience.

Four separate versions of the IC-μ4A/AT/E have been designed. This service manual covers every version. When using the manual each model can be referred to by the following assigned version numbers:

MODEL	VERSION NUMBER	AREA
IC-μ4E	#04	EUROPE
IC-μ4AT	#05	U.S.A.
IC-μ4A	#07	AUSTRALIA
IC-μ4AT	#09	SOUTHEAST ASIA

ORDERING REPLACEMENT PARTS

For faster, more efficient service include the following points when ordering parts or requesting information from your ICOM Service Center:

1. Equipment model and serial number
2. Schematic part identifier or service manual page number
3. Unit name and printed circuit board number (e.g., MAIN UNIT/B-1370B)
4. Component part number and name (e.g., 2SC3772 Transistor)
5. Quantity required (e.g., 10 pcs)

TABLE OF CONTENTS

The SCHEMATIC DIAGRAM is attached at the end of this service manual.

SECTION 1 SPECIFICATIONS

■ GENERAL

Frequency coverage :

MODEL	VERSION NUMBER	AREA	OPERATIONAL RANGE
IC-μ4E	#04	EUROPE	430.0000~439.9875MHz
IC-μ4AT	#05	U.S.A.	440.0000~449.9950MHz
IC-μ4A	#07	AUSTRALIA	430.0000~439.9950MHz
IC-μ4AT	#09	SOUTHEAST ASIA	430.0000~439.9950MHz

Frequency resolution : IC-μ4A/AT 5kHz IC-μ4E 12.5kHz

Antenna impedance : 50Ω unbalanced

Usable temperature range : −10°C~+60°C

Frequency stability : ±10ppm at −10°C~+60°C

Current drain at 8.4V DC :

Receiving	Power saved	Approx. 8mA
	At max. autio output	Max. 170mA
Transmitting	High (1.0W)	Max. 700mA
	Low (0.1W)	Max. 350mA

Dimensions (with BP-22) : 58 (61) W×140 (148) H×29 (33) Dmm

Bracketed values include projections.

Weight : 340g

■ TRANSMITTER

Output power : HIGH 1.0W LOW 0.1W

Emission mode : F3 (FM)

Modulation system : Variable reactance frequency modulation

Max. frequency deviation : ±5kHz

Spurious emissions : More than 60dB below carrier output power

■ RECEIVER

Receiving system : Double-conversion superheterodyne

Intermediate frequencies 1st 23.15MHz 2nd 455kHz

Sensitivity : Less than 0.25μV (−119dBm) for 12dB SINAD

Squelch sensitivity (Threshold) : Less than 0.1μV (−127dBm)

Spurious response rejection ratio : More than 60dB

Audio output power : More than 0.25W at 10% distortion with an 8Ω load

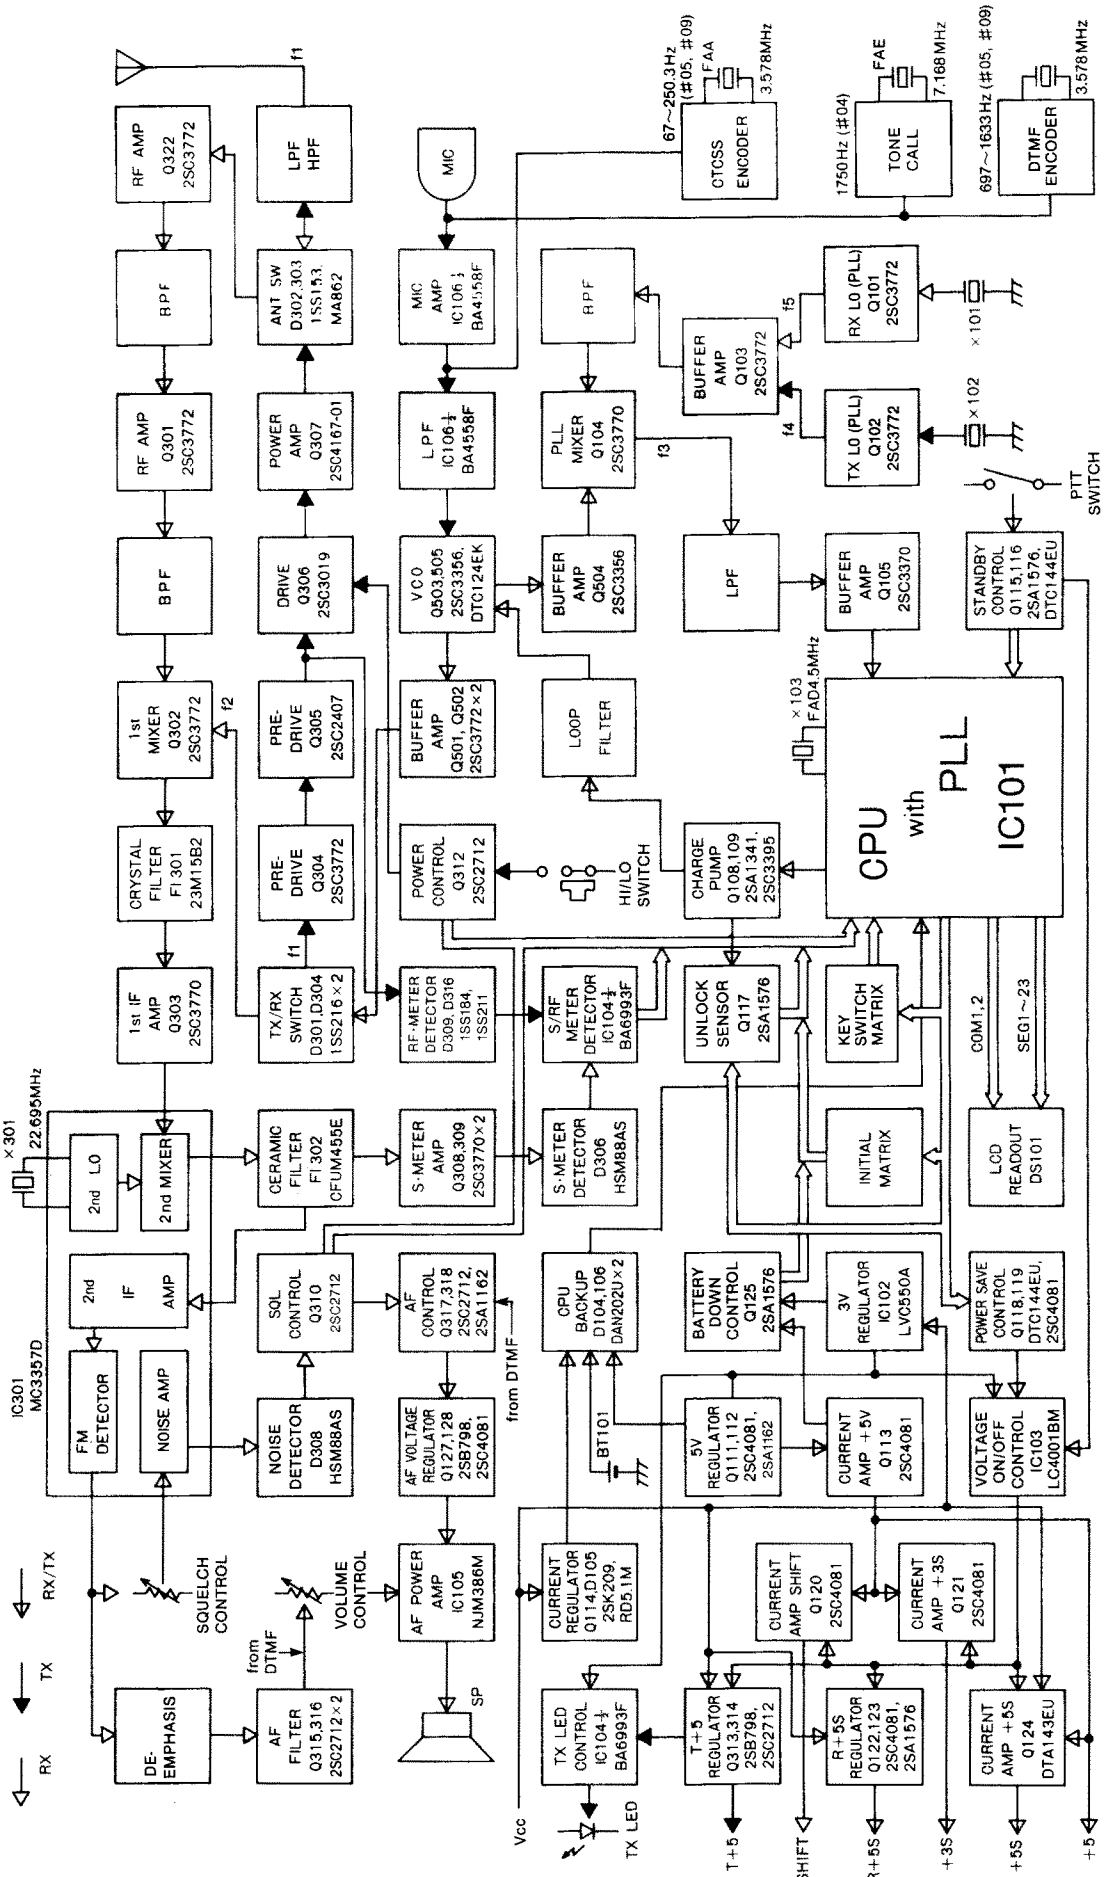
VERSION	f1 (TX Freq) MHz	f2 (Local Osc Freq) MHz	f3 (PLL IF) MHz	f4 (TX LO freq) MHz	f5 (RX LO freq) MHz
IC-μ4AT (#05)	440.0000 ~ 449.9950	416.8500 ~ 426.8450	11.9250 ~ 21.9200	428.075	404.925
IC-μ4A (#07, #09)	430.0000 ~ 439.9950	406.8500 ~ 416.8450	12.0250 ~ 22.0200	417.975	394.825
IC-μ4E (#04)	430.0000 ~ 439.9875	406.8500 ~ 416.8375	12.0250 ~ 22.0125		



SECTION 4 CIRCUIT DESCRIPTION

4-1 RECEIVER CIRCUITS

4-1-1 ANTENNA SWITCHING CIRCUIT (RF UNIT)

Receive signals enter the RF UNIT from the ANTENNA CONNECTOR and pass through a low-pass filter consisting of L301, L302 and others, and a high-pass filter consisting of C304, C306 and L303. The signals are then fed to the antenna switching circuit.

The antenna switching circuit employs a λ/4-type diode switching system consisting of D302, D303, L305, L306 and other parts. While receiving, D302 and D303 turn OFF and receive signals are applied to the RF amplifier circuit.

4-1-2 RF CIRCUIT (RF UNIT)

The receive signals from the antenna switching circuit are amplified at RF amplifiers Q322 and Q301. Band-pass filters are designed for the after stage of each RF amplifier circuit to further suppress out-of-band signals.

After passing through the bandpass filter, signals are fed to 1st mixer Q302 for conversion to 23.15MHz 1st IF signals with LO signals from the PLL circuit.

4-1-3 IF CIRCUIT (RF UNIT)

1st IF signals from Q302 pass through a pair of crystal filters (FI301) to suppress out-of-band signals and unwanted heterodyned frequency signals. After passing through the filter, the 1st IF signals are amplified at IF amplifier Q303, and are fed to IC301.

IC301 contains the 2nd LO circuit, 2nd mixer circuit, limiter amplifier circuit and quadrature detector circuit. The 2nd LO circuit and X301 generate 22.695MHz 2nd LO signals which are used at the 2nd mixer section of IC301.

1st IF signals from Q303 are fed to pin 16 of IC301, and are mixed with 2nd LO signals for converting the 1st IF signals to 455kHz 2nd IF signals.

The 2nd IF signals are output from pin 3 and pass through high quality ceramic filter FI302 to suppress unwanted heterodyned frequency signals. They are then amplified at the limiter amplifier section (pin 5 of IC301) and applied to a quadrature detector circuit (pin 8 of IC301 and ceramic resonator X302) to demodulate 2nd IF signals to AF signals.

4-1-4 AF CIRCUIT (MAIN UNIT)

AF signals output from pin 9 on IC301 pass through a de-emphasis circuit (R318, C326) and are amplified at Q316 and Q315. The de-emphasis circuit is an integrator circuit with frequency characteristics of −6dB/oct.

Amplified signals pass through VOLUME CONTROL R129 and are amplified at AF power amplifier IC105 to drive the SPEAKER.

4-1-5 SQUELCH CIRCUIT (RF UNIT)

A portion of signals from pin 9 of IC301 passes through the SQUELCH CONTROL (R128 in the MAIN UNIT) and is fed to active filter pin 10 of IC301 where it collects noise components of 20kHz or more.

The noise components are then rectified by D308 for conversion to DC voltage. When this voltage is at a HIGH level, Q310 is ON, and Q317 and Q318 are OFF. Thus the audio control (ACTR) line is at a LOW level and turns OFF the power source circuit for IC105 (Q127 and Q128).

While transmitting, the emitter of Q318 is "LOW" and the power source of IC105 is also OFF.

IF CIRCUIT

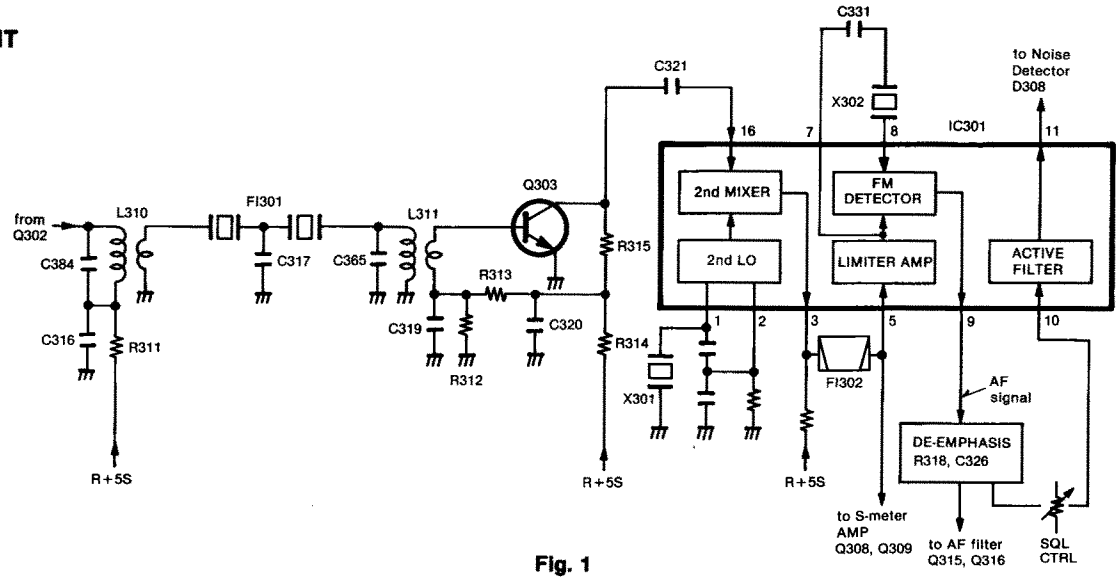


Fig. 1

4-1-6 S-METER CIRCUIT (RF UNIT)

A portion of signals passed from FI302 is amplified at S-meter amplifier Q308 and Q309, and is detected at voltage doubler rectifiers D306. These signals are then applied to meter comparator IC104B on the MAIN UNIT.

4-1-7 1st LO CIRCUIT (VCO UNIT)

412MHz band LO signals from the VCO UNIT are fed to transmit/receive switching circuit D304 on the RF UNIT. The signals are then applied to the base of 1st mixer Q302 as 1st LO signals.

4-2 TRANSMITTER CIRCUITS

4-2-1 MICROPHONE AMPLIFIER CIRCUIT (MAIN UINT)

AF signals from the INTERNAL MICROPHONE or from the EXTERNAL MIC JACK are amplified at limiter amplifier pin 3 of IC106. This limiter amplifier is formed by a negative feedback circuit with frequency characteristics set at 6dB/oct. in the 300Hz~3kHz range. This causes the limiter amplifier to function as a pre-emphasis circuit.

Output from the limiter amplifier is similar to a rectangular waveform and includes harmonic components. Harmonic components higher than 3kHz are attenuated by splatter filter pin 5 of IC106.

AF signals from pin 7 of IC106 pass through modulation adjusting trimmer pot R183 and then pass through the RF UNIT. The signals are then applied to D502 on the VCO UNIT for performing frequency modulation.

4-2-2 BUFFER AMPLIFIER CIRCUIT (PLL UINT)

430 or 440MHz band signals (OUT 2) from the VCO UNIT pass through transmit/receive switching circuit D301. They are then amplified at buffer amplifiers Q304 and Q305, and at driver Q306, thus obtaining wideband drive power.

4-2-3 POWER AMPLIFIER CIRCUIT

Amplified signals at Q306 are power amplified at Q307 and obtain more than 1W (when HIGH is selected) or 0.1W (when LOW is selected).

Output power from Q307 passes through an antenna switching circuit, a high-pass filter, a low-pass filter, and then is applied to the ANTENNA CONNECTOR.

POWER AMPLIFIER CIRCUIT

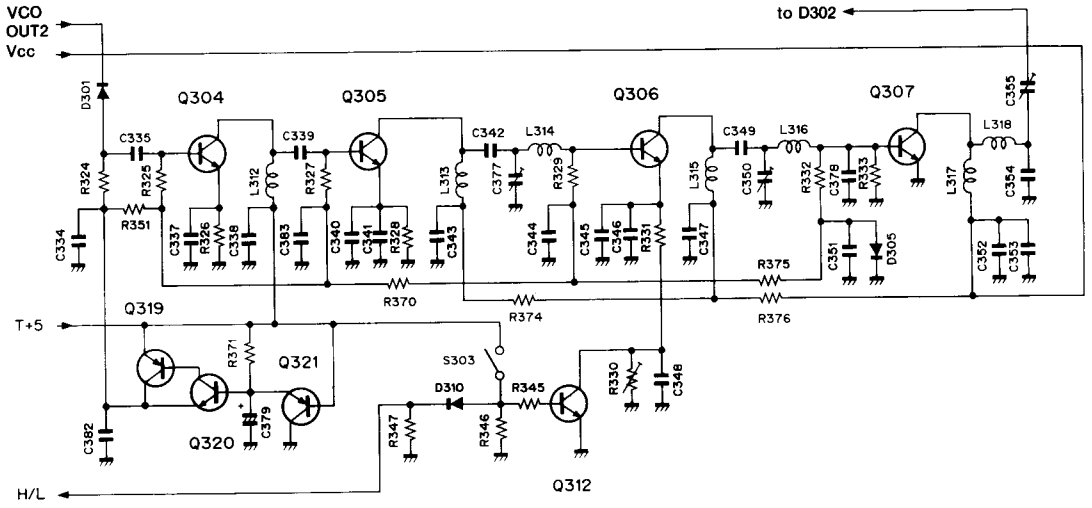

Fig. 2

4-3 PLL CIRCUITS

The PLL circuits adopt a dual modulus prescaler system and mixer system. The circuits consist of a local oscillator, a loop filter, a mixer circuit, and 3 more circuits contained in the CPU: a reference frequency circuit, a swallow counter, and a programmable counter.

4-3-1 LOCAL OSCILLATOR CIRCUIT (MAIN UNIT)

The local oscillator circuit employs a 3rd overtone oscillator circuit using X101 and Q101 in receive mode and X102 and Q102 in transmit mode. Oscillated signals are amplified at Q103 and are then applied to PLL mixer Q104. R+5S and T+5 switch each oscillator.

VERSION	FREQUENCY	
	RECEIVE	TRANSMIT
#05	404.925MHz	428.075MHz
#04, #07, #09	394.825MHz	417.975MHz

4-3-2 PLL MIXER CIRCUIT (MAIN UNIT)

The oscillated signals (OUT 1) from the VCO UNIT are applied to the base of Q104 and are mixed with local

oscillator signals from Q103. The minus heterodyned frequency is picked up at a low-pass filter consisting of L107, L108 and other parts, and is amplified at Q105, then fed to pin 9 of the CPU.

4-3-3 DUAL MODULUS PRESCALER (MAIN UNIT)

CPU IC101 incorporates a reference oscillator circuit, a swallow counter, a programmable counter and a phase detector separate from the logic circuits.

The mixed signals input from pin 9 are divided either by 1/32 or 1/33 by a prescaler. They are divided with N-data by a programmable divider, phase detected with a reference oscillator by a phase detector, and are output from pins 11 and 12.

4-3-4 REFERENCE OSCILLATOR CIRCUIT (MAIN UNIT)

4.5MHz signals are oscillated at reference oscillator X103 and are divided by 1/900 (1/720 #04) to obtain a reference frequency of 5kHz (6.25kHz #04). The reference frequency is used at the phase detector as explained in SECTION 4-3-3.

4-3-5 LOOP FILTER (MAIN UNIT)

Phase-detected signals from pins 11 and 12 are converted to DC voltage by charge pump Q108 and Q109, and a loop filter (low-pass filter) consisting of R117, R118, R120, R121, C123, and VCO UNIT C526.

Q106 is an accelerator which ensures rapid PLL lockup times.

4-3-6 VCO CIRCUIT (VCO UNIT)

In receive mode, the SHIFT voltage is "HIGH". This turns Q505 and D502 ON and adds C509, C510 and C522 for oscillation. In transmit mode, the SHIFT voltage is "LOW" and D502 is reverse biased. Modulation signals then change the capacitance of D502 to make an FM modulation.

VCO oscillating signals are controlled by varactor diode D501 with PLL lock voltage (LV) from the MAIN UNIT.

4-3-4 UNLOCK CIRCUIT (PLL UNIT)

When the PLL circuit is unlocked, Q110 turns ON and a "LOW" level signal passes through integrator circuit R143 and C139. The signal is then fed to Q117 which turns ON and outputs a "HIGH" MUTE signal to pin 17 of the CPU.

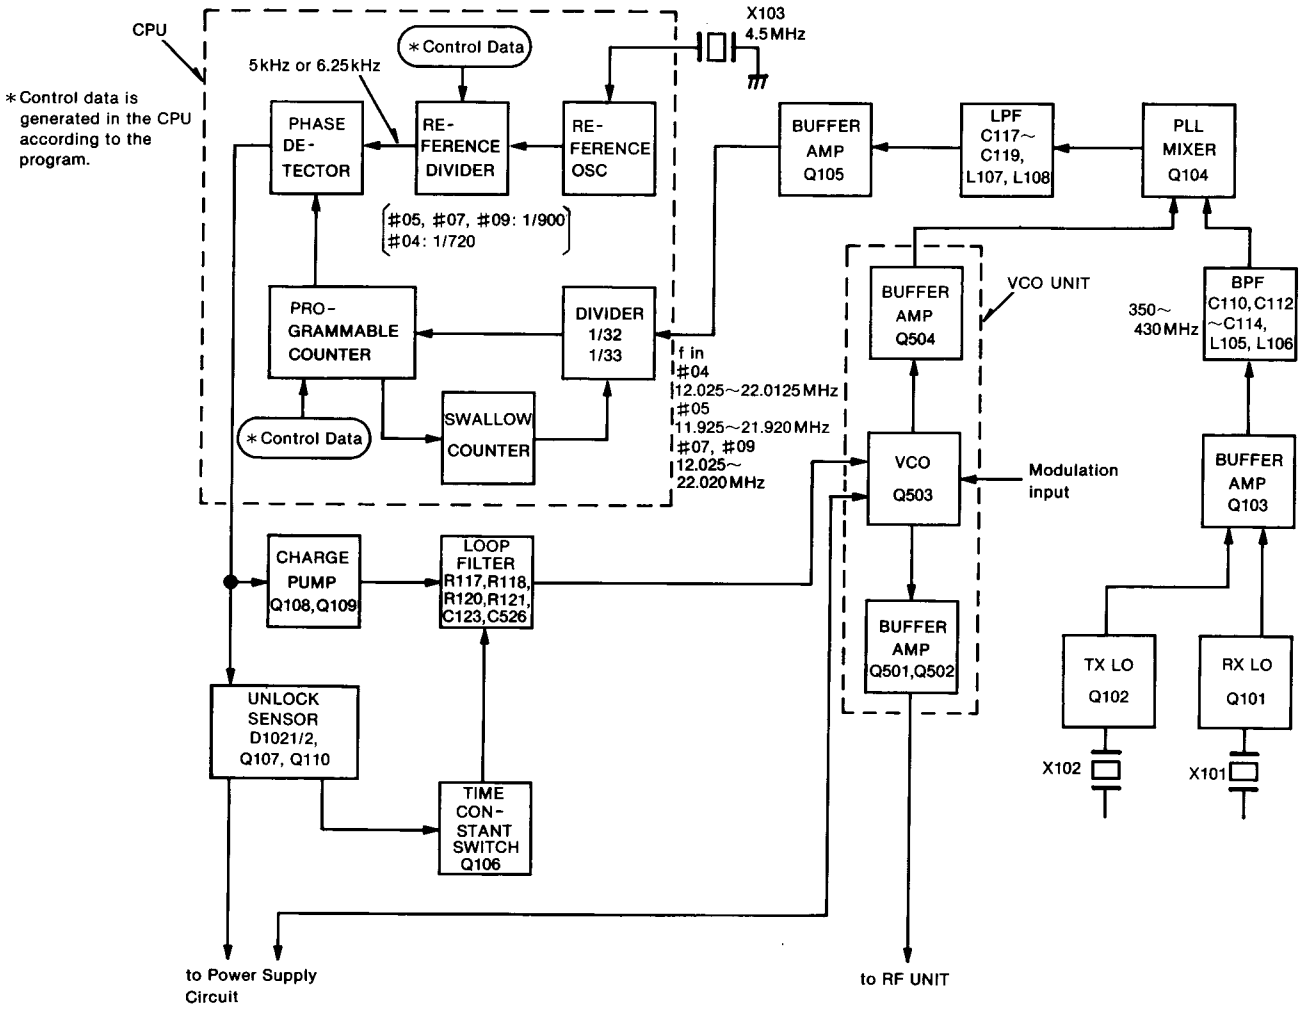

Fig. 3

4-4 LOGIC CIRCUITS

4-4-1 CPU PORT ALLOCATIONS

Following is an explanation of operations and their I/O ports.

PIN NUMBER	PORT NUMBER	TERMINAL	I/O	DESCRIPTION
17	PA3	MUTE	IN/ OUT	Receives "HIGH" when the PLL is unlocked. Outputs "HIGH" when out-of-ham band or offset write condition is selected.
18	PA2	H/L BUSY	IN	Receives "LOW" when the squelch is closed or the RF output [LOW] position is selected. Receives "HIGH" when the squelch is open or the RF output [HIGH] position is selected.
19	PA1	AD IN	IN	AD 01~AD 03 are indicated on the S/RF INDICATOR when "LOW" is received.
21~24	K3~K0	KEY 3~0	IN	Key matrix input ports. Refer to SECTION 4-4-3.
25~27	PB3~PB1	STB 3~1	OUT	Key matrix output ports with PC2. Refer to SECTION 4-4-3.
28	PB0	LAMP	OUT	Refer to SECTION 4-4-6.
29	PC3	PSC	OUT	Power save signal output ports. Refer to SECTION 4-4-5.
30	PC2	ADO 3	OUT	Key matrix output port with PB3~PB1. Comparison output ports with PC1 and PC0.
31, 32	PC1, PC0	ADD 2, 1	OUT	Comparison output ports with PC2. Outputs a loop counter number and counts up until the PA1 port receives "LOW" to compare and read S-meter voltage.

4-4-2 INITIAL MATRIX

The initial matrix determines the frequency range, tuning steps, etc., when the CPU is initialized.

The CPU outputs "HIGH" strobe signals in sequence to the initial matrix: PC0→PC3→PB0→PB2.

After finishing the strobe scan, output ports for initial matrix operate the other functions as described in SECTION 4-4-1.

INITIAL MATRIX CIRCUIT

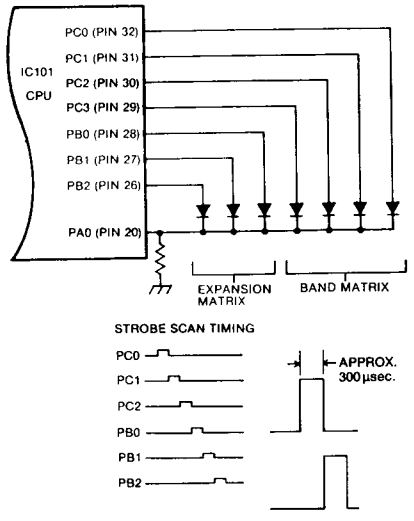

Fig. 4

4-4-3 KEY MATRIX

The key matrix checks all switch conditions.

When all non-lock type switches remain OFF:

PB1~PB3 ports remain "HIGH" and strobe scan does not function. The F.LOCK SWITCH also is not checked.

When one of non-lock type switches is pushed:

1) Any of input ports K0~K3 is "HIGH".
2) The CPU then starts strobe scanning to search for a switch to turn ON.
3) After searching, output ports PB1~PB3 are at "LOW" and the PC2 port is "HIGH" for checking the lock-type switch condition.

Example: While pushing the 100kHz switch upwards when the DUP/SIM SWITCH is selected at "-DUP".

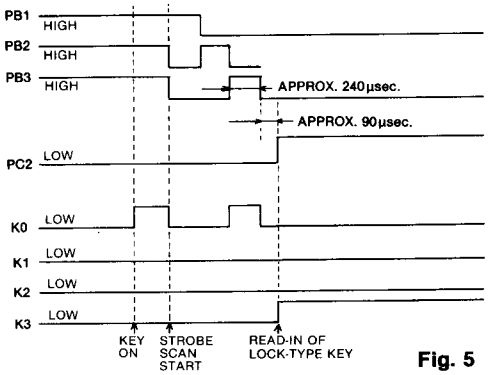

Fig. 5

HARDWARE CONFIGURATION OF KEY MATRIX

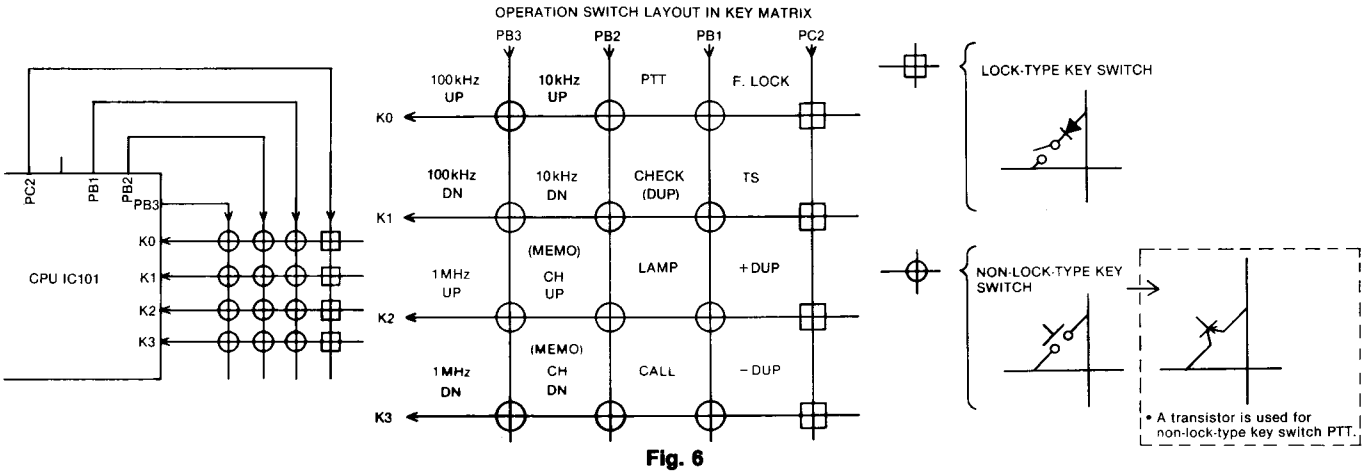

Fig. 6

4-4-4 METER COMPARATOR

When receiving:

The voltage detected in the S-meter circuit is input to pin 6 of IC104B. A/D signals from the CPU are fed to pin 5 of IC104B.

The CPU then counts up and outputs 3-bit digital signals (additional scan) until pin 5 of IC104B becomes higher than pin 6. These signals are converted to analog signals with R158~R160.

When a PA1 port receives "HIGH", the CPU indicates a counting number minus 1 to the S/RF INDICATOR. When PA 1 port does not receive "HIGH" until finishing an additional scan, the S/RF indicator shows full scale.

When the PA2 port receives "HIGH", 1 dot appears on the S/RF INDICATOR. The squelch is in an open condition and the power saver function does not operate.

When transmitting:

The PC1 port is "HIGH", PC0 and PC2 are "LOW", and the S/RF line is fixed at "LOW" so additional scanning cannot start. The S/RF INDICATOR shows full scale when the PA2 port is "HIGH", and 3 dots when the PA2 port is "LOW".

S/RF INDICATOR VOLTAGE DETECTION AND SQUELCH OPEN DETECTION

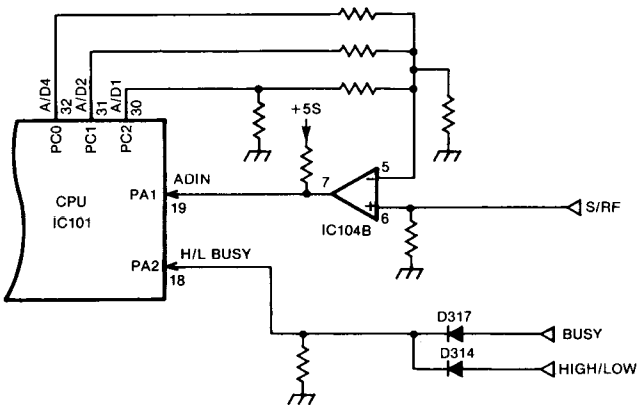

Fig. 7

4-4-5 POWER SAVER CIRCUIT

The power saver function starts when no signals are received by the CPU after 30sec. (when no switch is pushed, the squelch is closed, or when the transceiver is in receive mode).

When the power saver function starts, the PC3 port outputs a power save signal as in the following timing diagram.

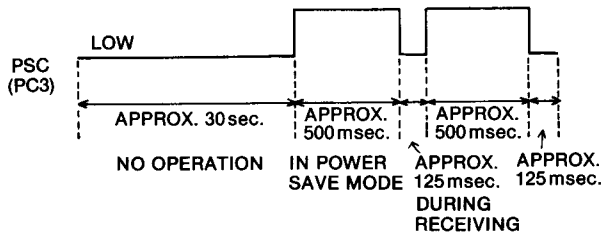

Fig. 8

While the PC3 port outputs "HIGH", +3S, R+5S and +5S lines are 0V and other circuits other than the CPU power source circuit do not function.

POWER SAVER CIRCUIT

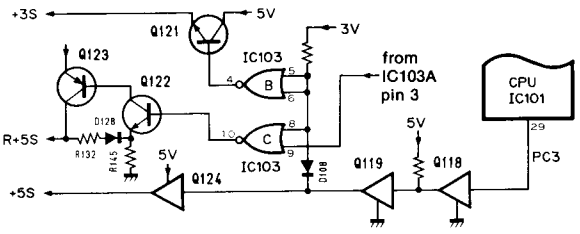

Fig. 9

4-4-6 LAMP CIRCUIT

When the LAMP SWITCH is pushed, the PB0 port remains "HIGH" for 5sec.

PB0: "HIGH": The LCD backlight comes on.
"LOW": The LCD backlight goes out.

If the LAMP SWITCH is pushed again when the PB0 port is in a "HIGH" condition, the PB0 port returns to "LOW".

If any non-lock type switches are pushed while PB0 remains "HIGH", the 5sec. timer starts after non-lock type switches are released (except for the PTT and CHECK SWITCHES).

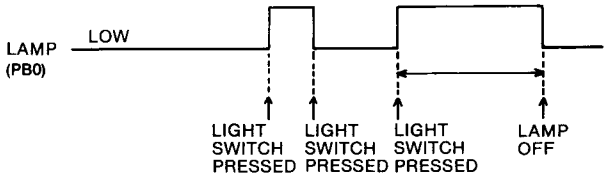

Fig. 10

4-5-3 REDUCED VOLTAGE DETECTING CIRCUIT (MAIN UNIT)

The reduced voltage detecting circuit consists of IC104A, R147 and R148. A regulated 3V is applied to pin 3 of IC104A. The voltage of the Vcc is divided by R148 and R147, and is applied to pin 2.

If the Vcc voltage decreases to less than 5.45V, the voltage at pin 2 is less than that at pin 3 and the output voltage at pin 1 of IC104A is "HIGH". The TRANSMIT INDICATOR does not light up even if the PTT SWITCH is pushed.

REDUCED VOLTAGE DETECTING CIRCUIT

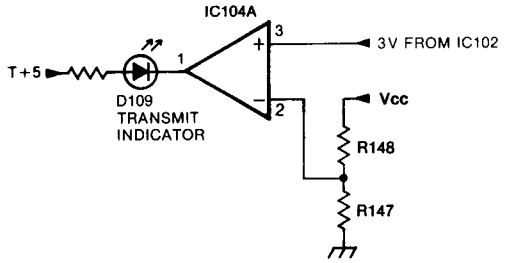

Fig. 11

4-5 POWER SUPPLY CIRCUITS

4-5-1 VOLTAGE LINES

LINE	DESCRIPTION
HV	From the BATTERY PACK directly.
VCC	HV voltage passed through the POWER SWITCH.
+3S	Common 3V controlled by the power save function. Made at Q121 and IC103B.
+5S	Common 5V controlled by the power save function. Made at Q124.
R+5S	Receive 5V controlled by the power save function. Current amplified at Q122 and Q123.
T+5C	Transmit 5V controlled by a MUTE signal. Made at IC103D.
T+5	Transmit 5V current amplifed of T+5C at Q313 and Q314 in the RF UNIT.

4-5-2 CPU POWER SOURCE CIRCUIT (MAIN UNIT)

When the battery pack is remove from the transceiver, a voltage is applied to the CPU via D106 from LITHIUM BACKUP BATTERY BT101 to provide backup for the memory contents.

4-6 OTHER CIRCUITS

4-6-1 DTMF ENCODER CIRCUIT (DTMF UNIT) [#05 and #09 versions only]

IC601, the DTMF encoder, generates Dual Tone Multi-Frequencies. If any keys on the KEYBOARD are pushed while transmitting, the proper frequency dividing ratio for the dividing frequency of X601 (3.58MHz) is selected. One set of audio frequencies corresponding to row input and column input are then output from pin 17.

Also, a "HIGH" level is applied from pin 10 of IC601 when the KEYBOARD is activated. This level has a time constant of approximately 1sec. for turning Q601 ON. Thus key entries can be made without holding the PTT SWITCH down.

4-6-2 SUBAUDIBLE TONE ENCODER CIRCUIT (TONE UNIT) [#05 and #09 versions only]

When the SUBAUDIBLE TONE SWITCH or P7 of S701 is turned ON, IC701 generates subaudible tones. A generated tone is made from dividing oscillator X701, and the dividing ratio is fixed by the P1~P6 switches on S701.

4-7-6 TONE CALL CIRCUIT (TONE UNIT) [#04 version only]

The TONE CALL UNIT generates a 1750Hz tone to open a repeater. When the TONE CALL SWITCH is pushed, Q801 is turned ON and T+5V is applied to IC801. IC801 divides 7.1680MHz by 1/4096 and outputs 1750Hz from pin 4.

SECTION 5 MECHANICAL PARTS AND DISASSEMBLY

5-1 FRONT PANEL DISASSEMBLY

1. Turn the POWER/VOLUME CONTROL OFF and remove the BATTERY PACK as shown in Fig. 5-1-1.

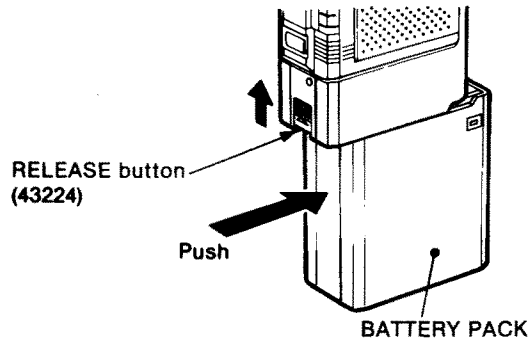

Fig. 5-1-1

2. Remove the 4 screws Ⓐ on the bottom and the sliding guide as shown in Fig. 5-1-2.

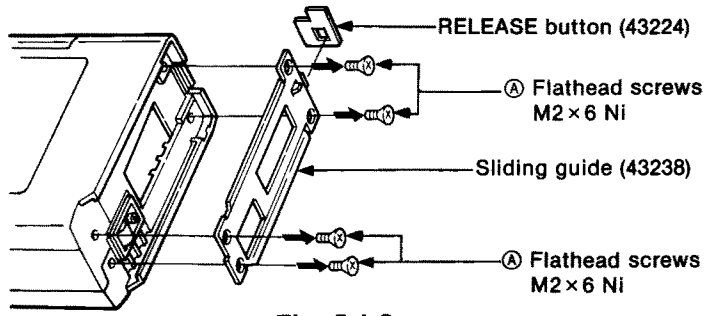

Fig. 5-1-2

3. Remove the screw Ⓑ and the FRONT PANEL as shown in Fig. 5-1-3.
4. Remove the PTT button and the LIGHT button.

IC-μ4E/A (#04, #07)
CAUTION:
Be careful not to cut the lead wires of the speaker.

IC-μ4AT (#05, #09)
CAUTION:
Be careful not to cut the lead wires of the speaker and the flexible board.

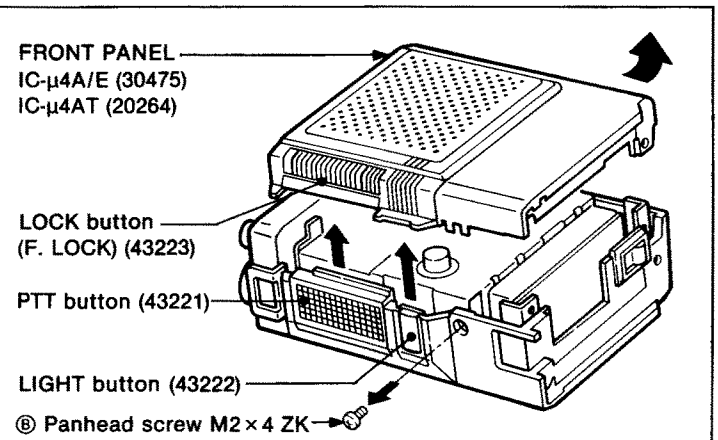

Fig. 5-1-3

IC-μ4AT (#05, #09)

5. Unsolder solder point Ⓐ to remove the flexible board.

NOTE: When assembling the FRONT PANEL, turn the flexible board in as shown here.

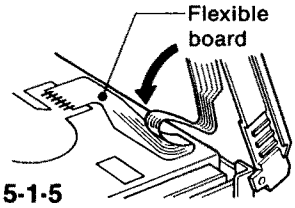

Fig. 5-1-5

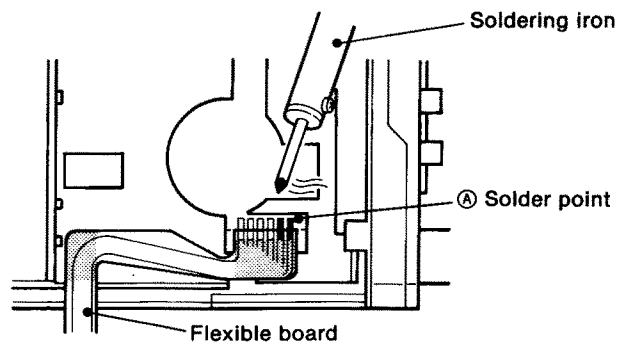

Fig. 5-1-4

5-2 SPEAKER DISASSEMBLY

1. Remove the 4 screws Ⓐ and the speaker plate as shown in Fig. 5-2-1 and Fig. 5-2-2.

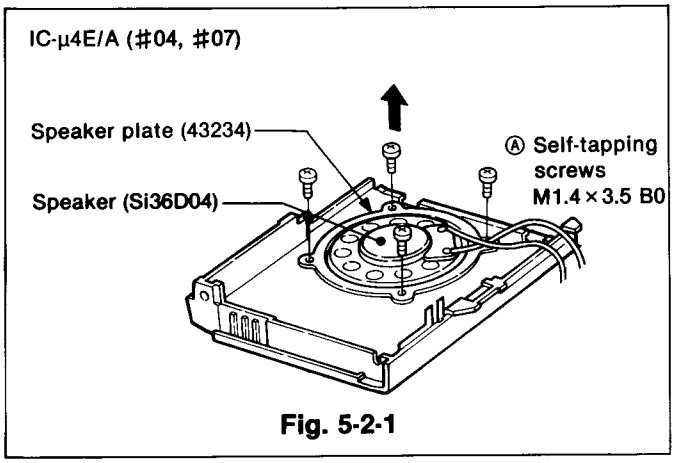

Fig. 5-2-1

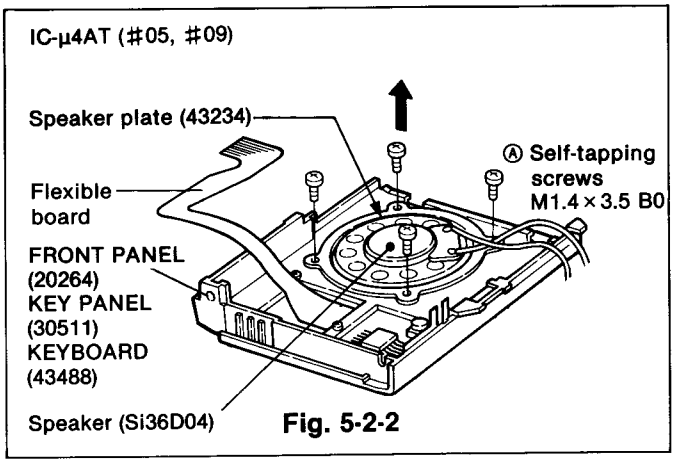

Fig. 5-2-2

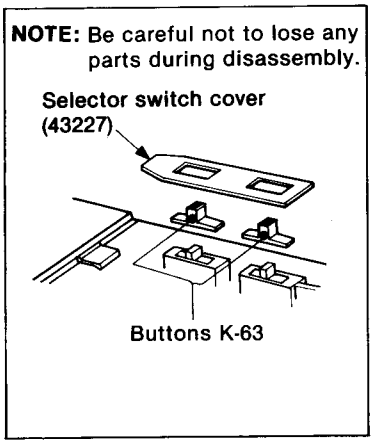
5-3 REAR CASE DISASSEMBLY

1. Remove the battery terminal from the bottom case and remove the rear case as shown in Fig. 5-3-1.
2. Remove the shield plate.



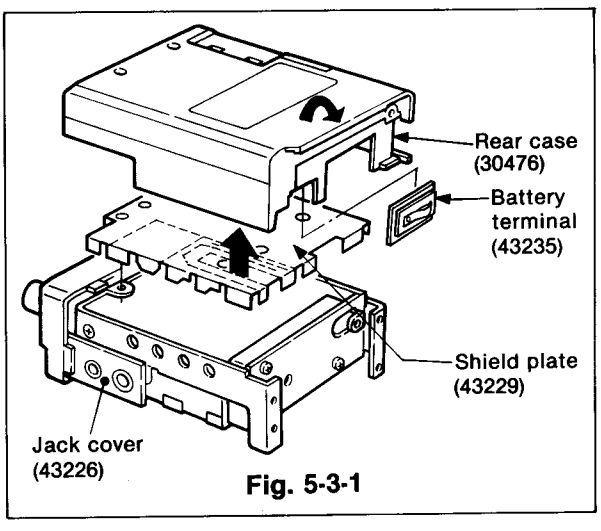


Fig. 5-3-1

5-4 TOP PANEL DISASSEMBLY

1. Remove the POWER/VOLUME CONTROL knob and the SQUELCH CONTROL knob.
2. Remove the TOP PANEL, making sure 4 hooks are free from the front and rear chassis.

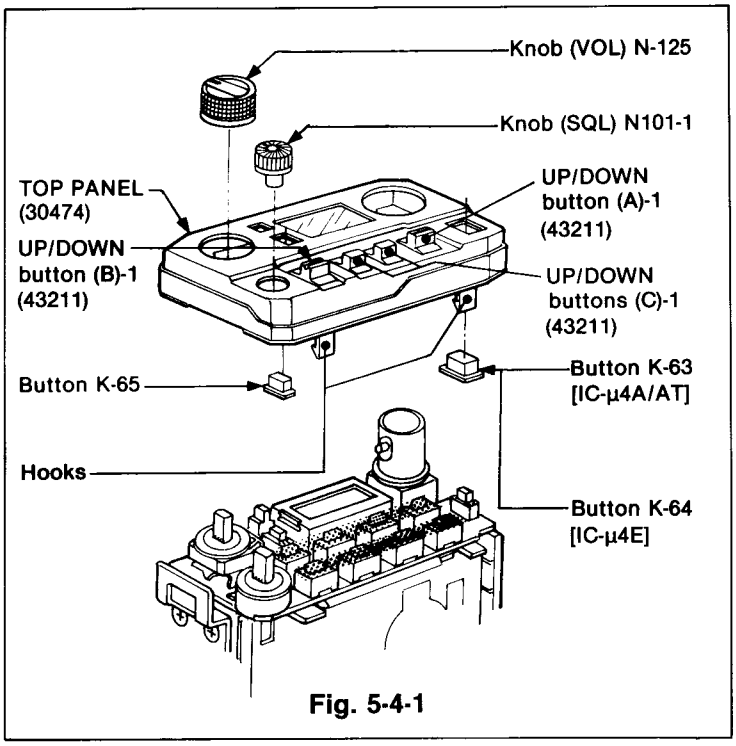

Fig. 5-4-1

5-5 TONE UNIT/TONE CALL UNIT DISASSEMBLY

1. Pull out the flexible board from the MAIN UNIT as shown in Fig. 5-5-1.

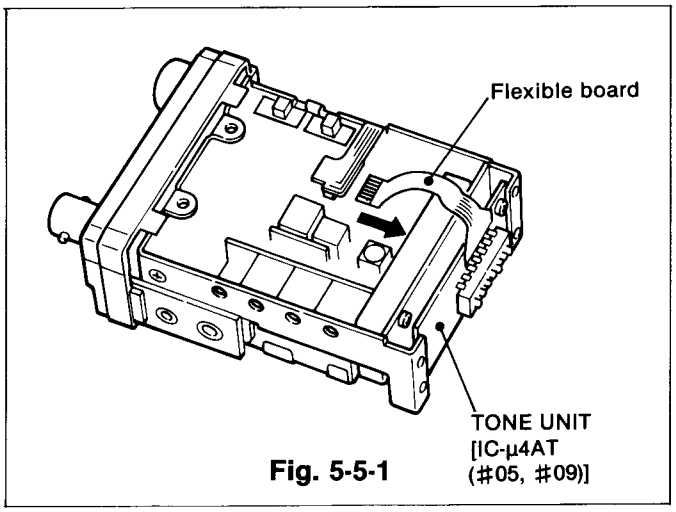

Fig. 5-5-1

2. Remove the screw Ⓐ and the TONE UNIT/TONE CALL UNIT as shown in Fig. 5-5-2.

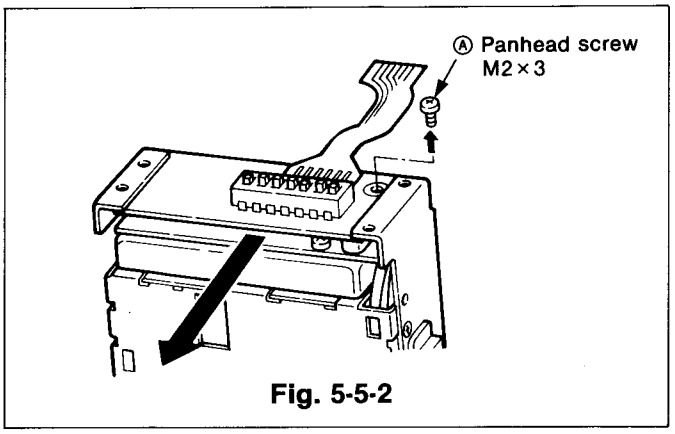

Fig. 5-5-2

SECTION 6 MAINTENANCE AND ADJUSTMENT

6-1 PREPARATION BEFORE SERVICING

1. Detach the power cord and turn OFF the POWER SWITCH before performing any work on the transceiver.

2. DO NOT short circuit components while making adjustments.

3. Use an insulated tuning tool for all adjustments.

4. DO NOT force any of the variable components. Turn them slowly and smoothly.

5. Follow the instructions exactly. If an indicated result is not obtained, repeat the instruction until the correct result is obtained.

6. Check the condition of connectors, solder joints and screws when adjustments are complete. Make sure components DO NOT touch each other.

7. Confirm defective operation of the transceiver first when checking an out-of-service unit. Verify that external sources DO NOT cause the problem.

8. Use the correct tools and test equipment.

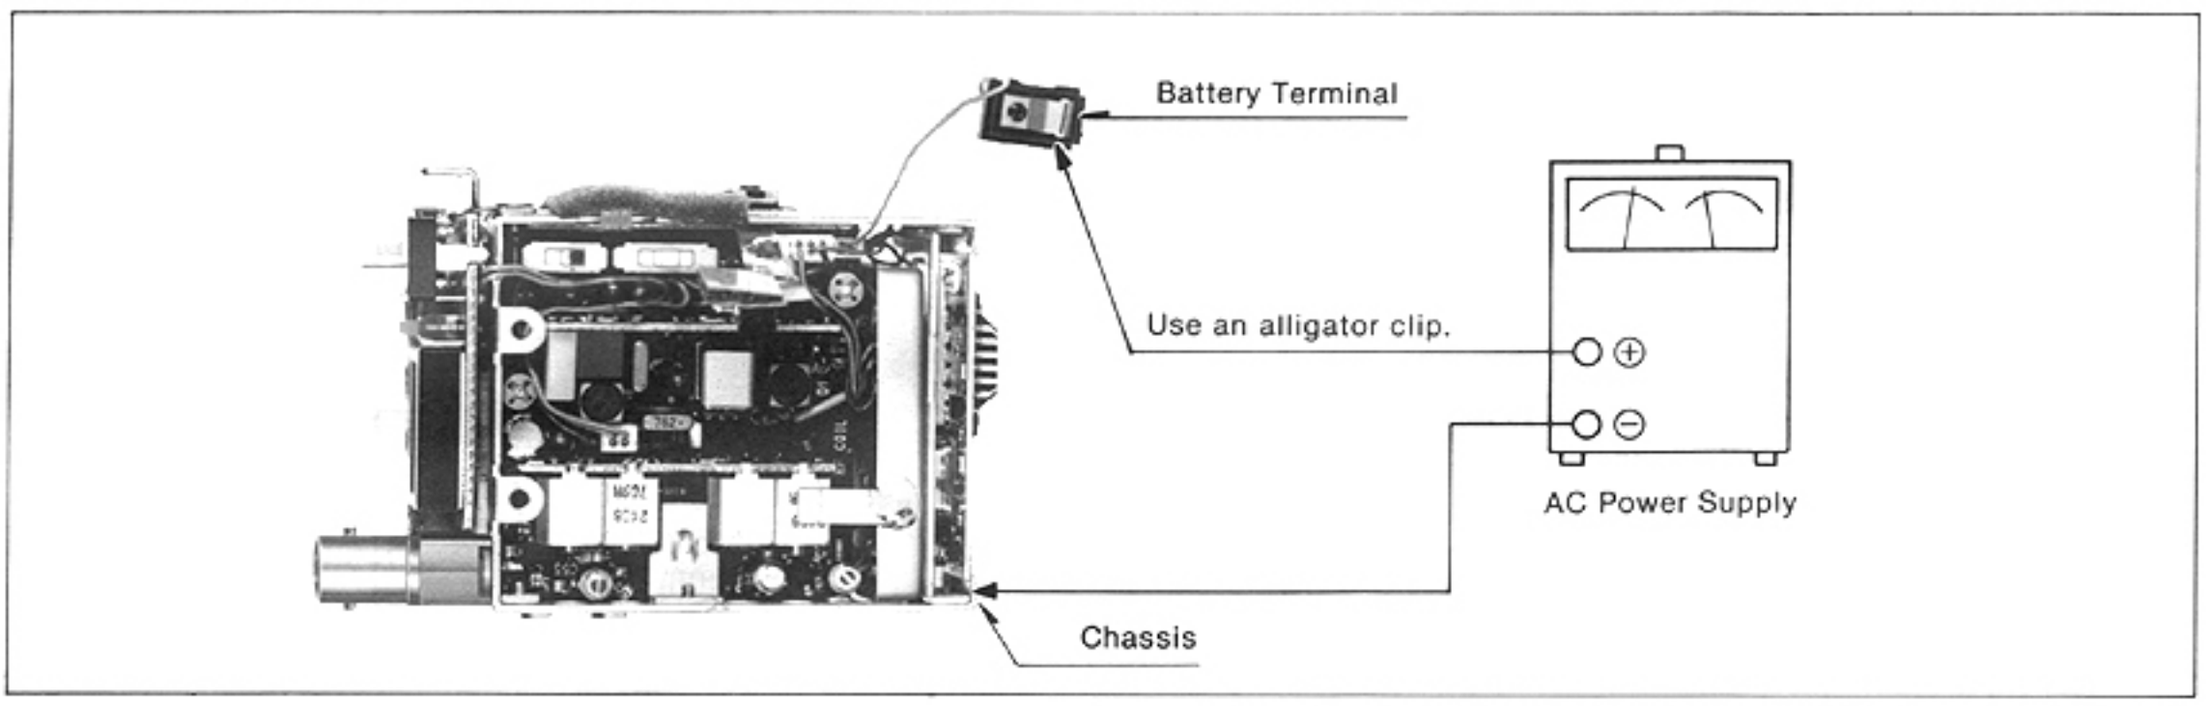
9. Remove the transceiver case as shown in SECTION 5.

10. For transmission problems, attach a dummy load to the ANTENNA CONNECTOR. For reception problems, attach an antenna or signal generator to the ANTENNA CONNECTOR. DO NOT transmit into the signal generator.

11. Recheck for the suspected malfunction with the POWER SWITCH ON.

12. Check the defective circuit. Measure the DC voltages of the collector, base and emitter of each transistor.

13. There are different versions of this transceiver. Adjustment procedures and results may differ for each version. Be sure to follow the correct procedure for the transceiver you adjust.



6-2 PLL ADJUSTMENT

TEST INSTRUMENTS REQUIRED	MEASUREMENT CONNECTION LOCATION
(1) AC POWER SUPPLY • Output voltage : 9V DC ±15% • Current capacity : 2A or more (2) FREQUENCY COUNTER • Frequency range : 0.1~500MHz • Frequency accuracy : ±1ppm or better • Sensitivity : 100mV or better (3) DC VOLTMETER • Input impedance : 50kΩ/DC or better	
ADJUSTMENT		ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT

ADJUSTMENT		ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
			UNIT	LOCATION		UNIT	ADJUST
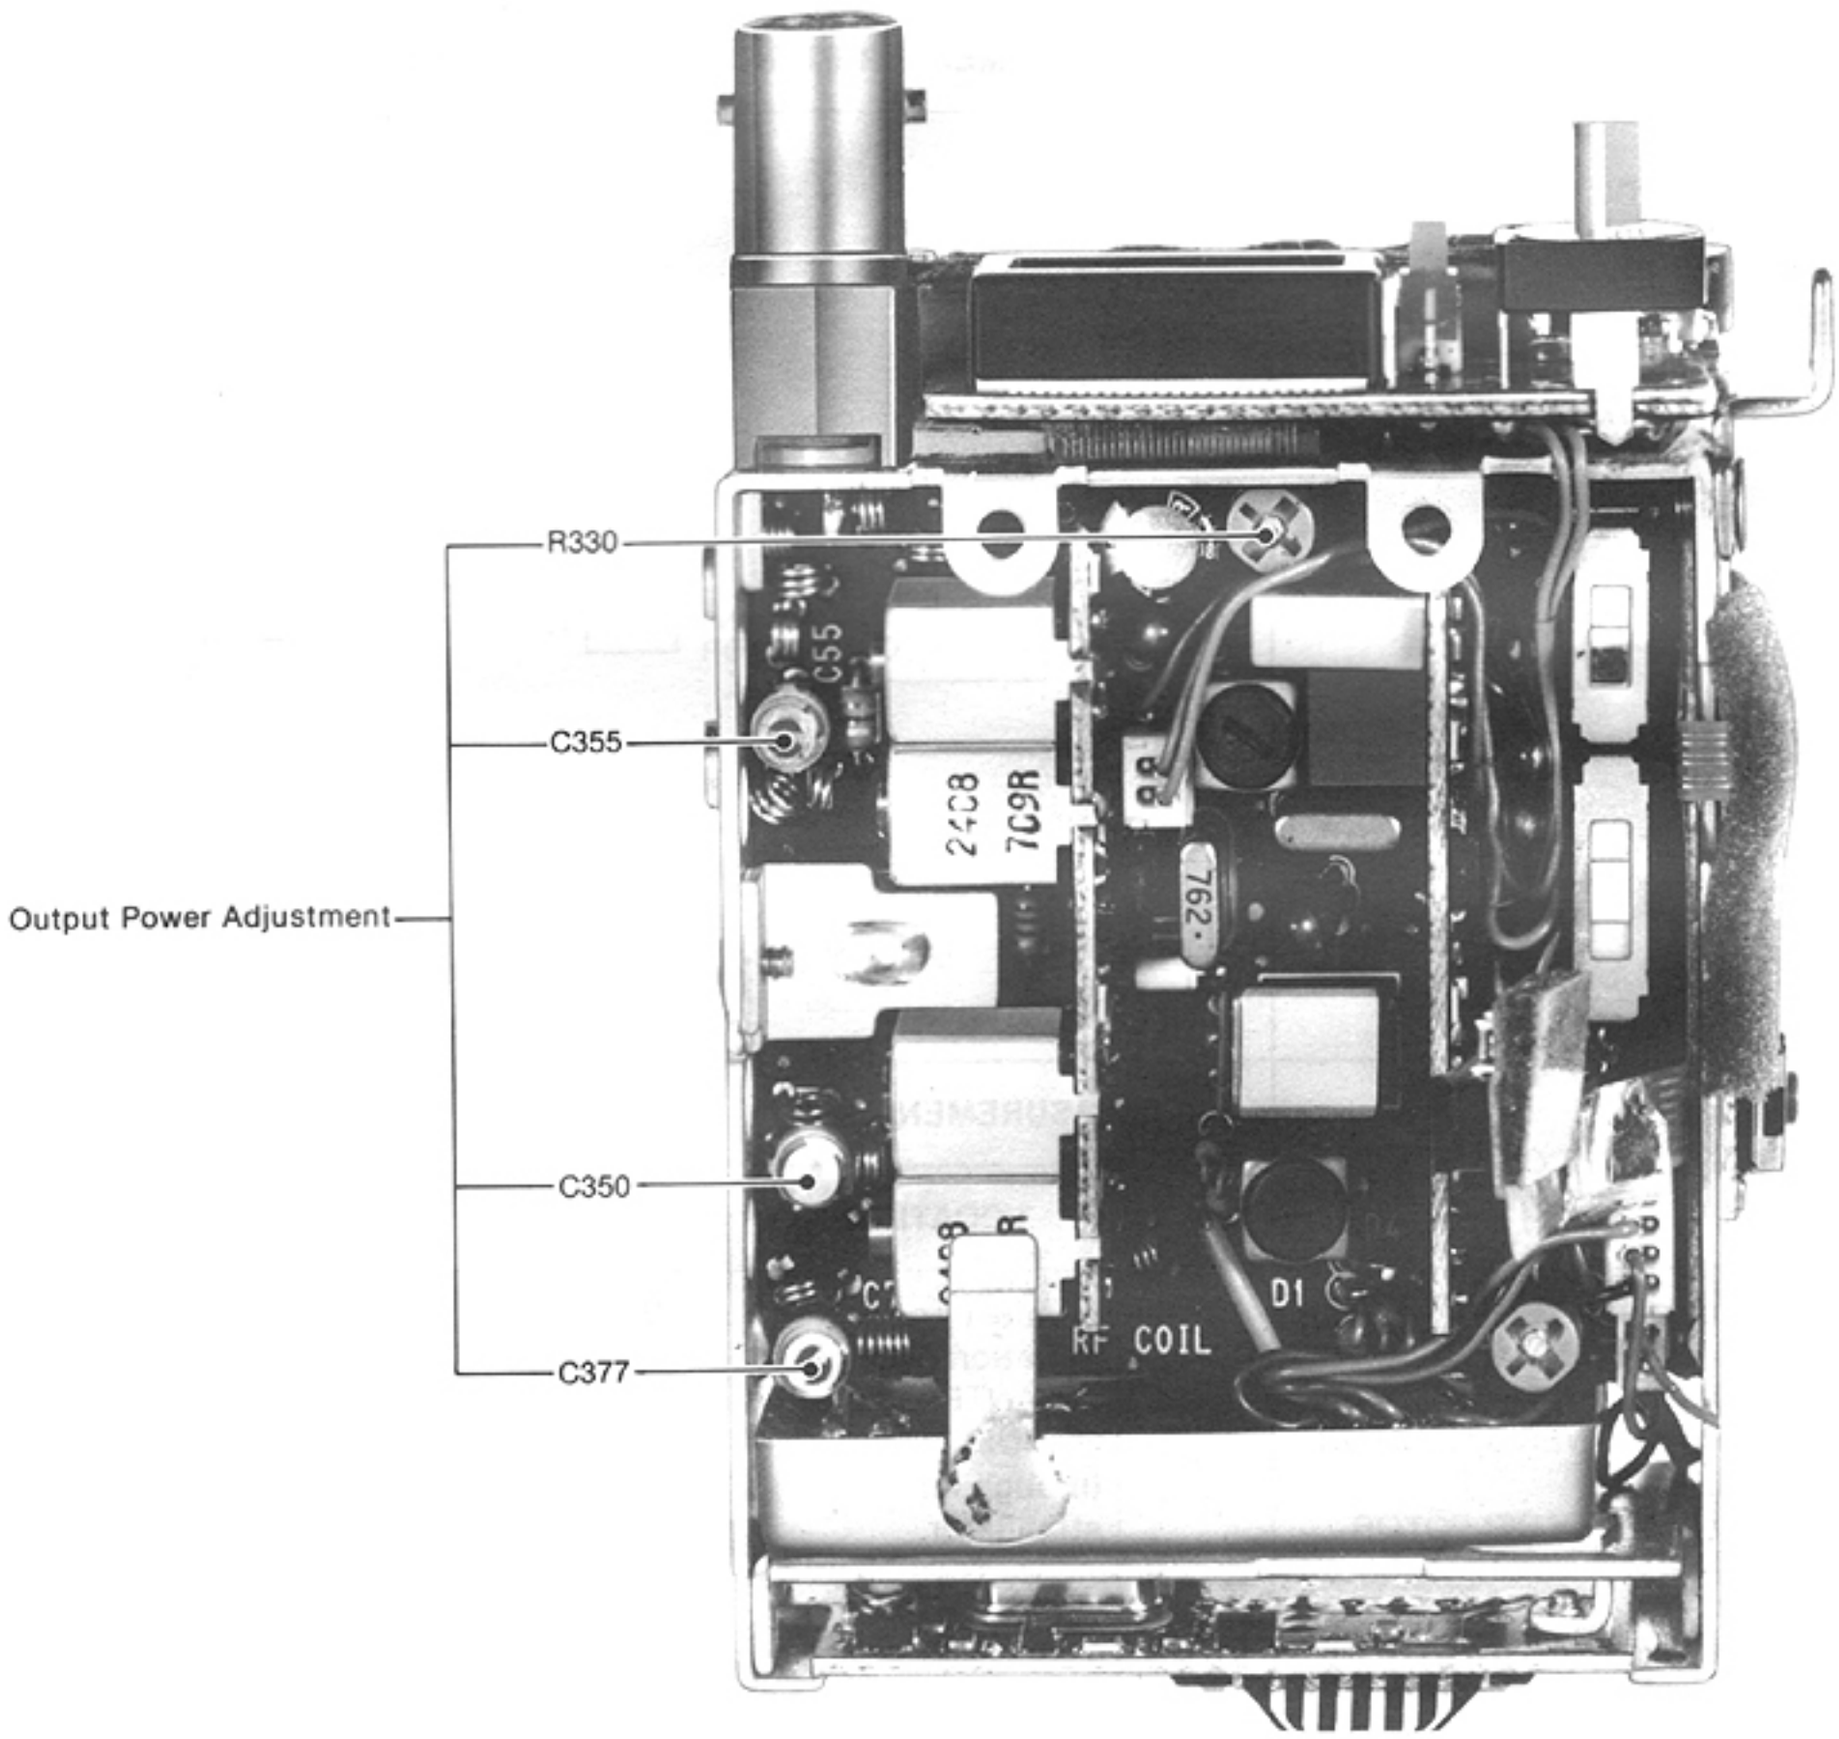
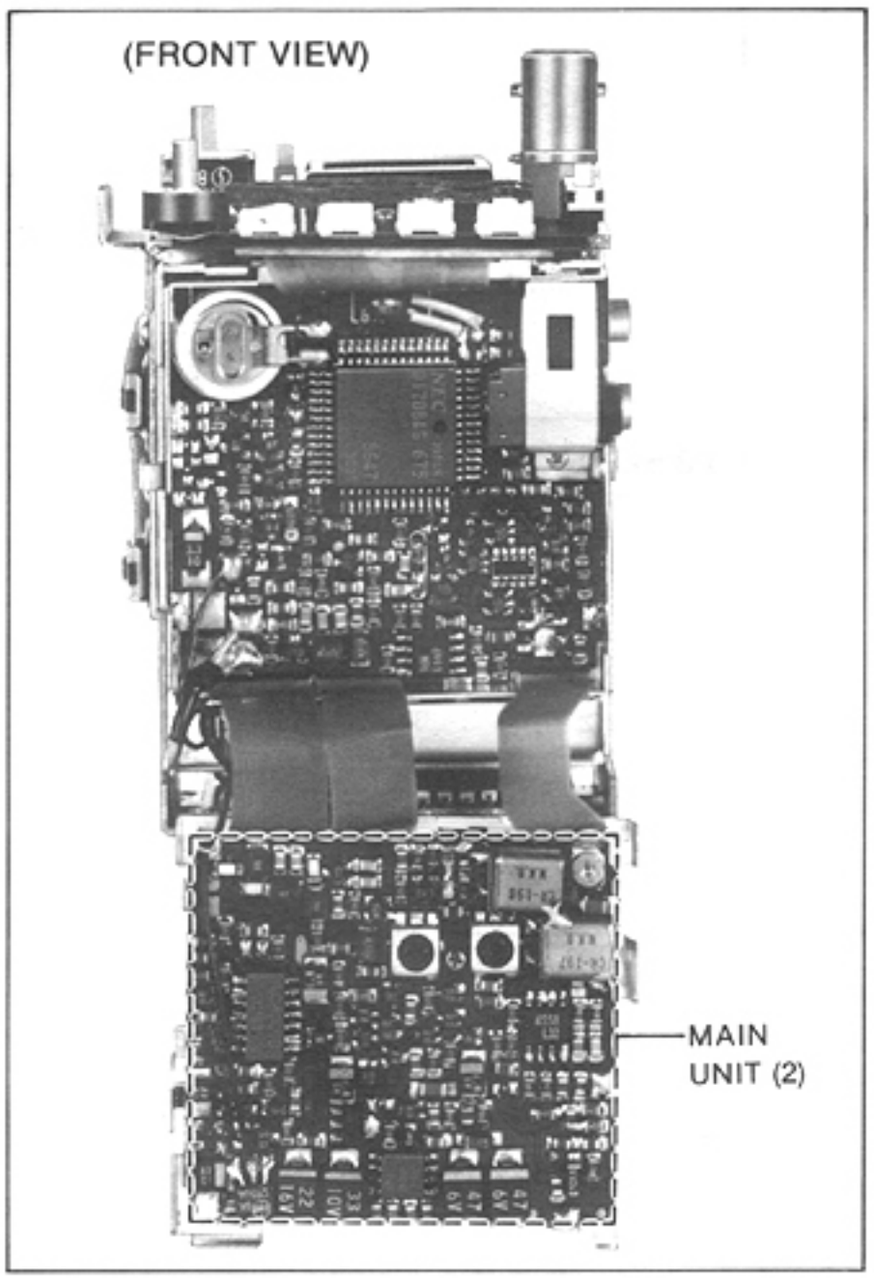
OUTPUT POWER	1	• Frequency display: 435.00MHz (#04, #07, #09) 445.00MHz (#05) • RF OUTPUT POWER SELECTOR SWITCH: HIGH • SIMPLEX/DUPLEX SELECTOR SWITCH: SIM • Transmit mode	TOP PANEL	Connect an RF power meter to the ANTENNA CONNECTOR.	Adjust to maximum output.	RF	C377, C350, C355
	2		BOTTOM PANEL	Connect an ammeter between the AC power supply and the transceiver.	Less than 600mA		C355
	3	• RF OUTPUT POWER SELECTOR SWITCH: LOW	TOP PANEL	Connect an RF power meter to the ANTENNA CONNECTOR.	0.1W		R330
		NOTE: Repeat above adjustment 1 several times.					
DEVIATION	1	• Frequency display: 435.00MHz (#04, #07, #09) 445.00MHz (#05) • RF OUTPUT POWER SELECTOR SWITCH: HIGH • SIMPLEX/DUPLEX SELECTOR SWITCH: SIM • Apply an AF signal to the EXT. MIC JACK. Level: 1kHz/40mV (#04, #07, #09) 1kHz/100mV (#05) • FM deviation meter HPF : 50Hz LPF : 20kHz De-emphasis : OFF Deviation sense: P-P/2 • Transmit mode	TOP PANEL	Connect an FM deviation meter to the ANTENNA CONNECTOR through an attenuator.	±4.8kHz	MAIN (2)	R183

RF UNIT

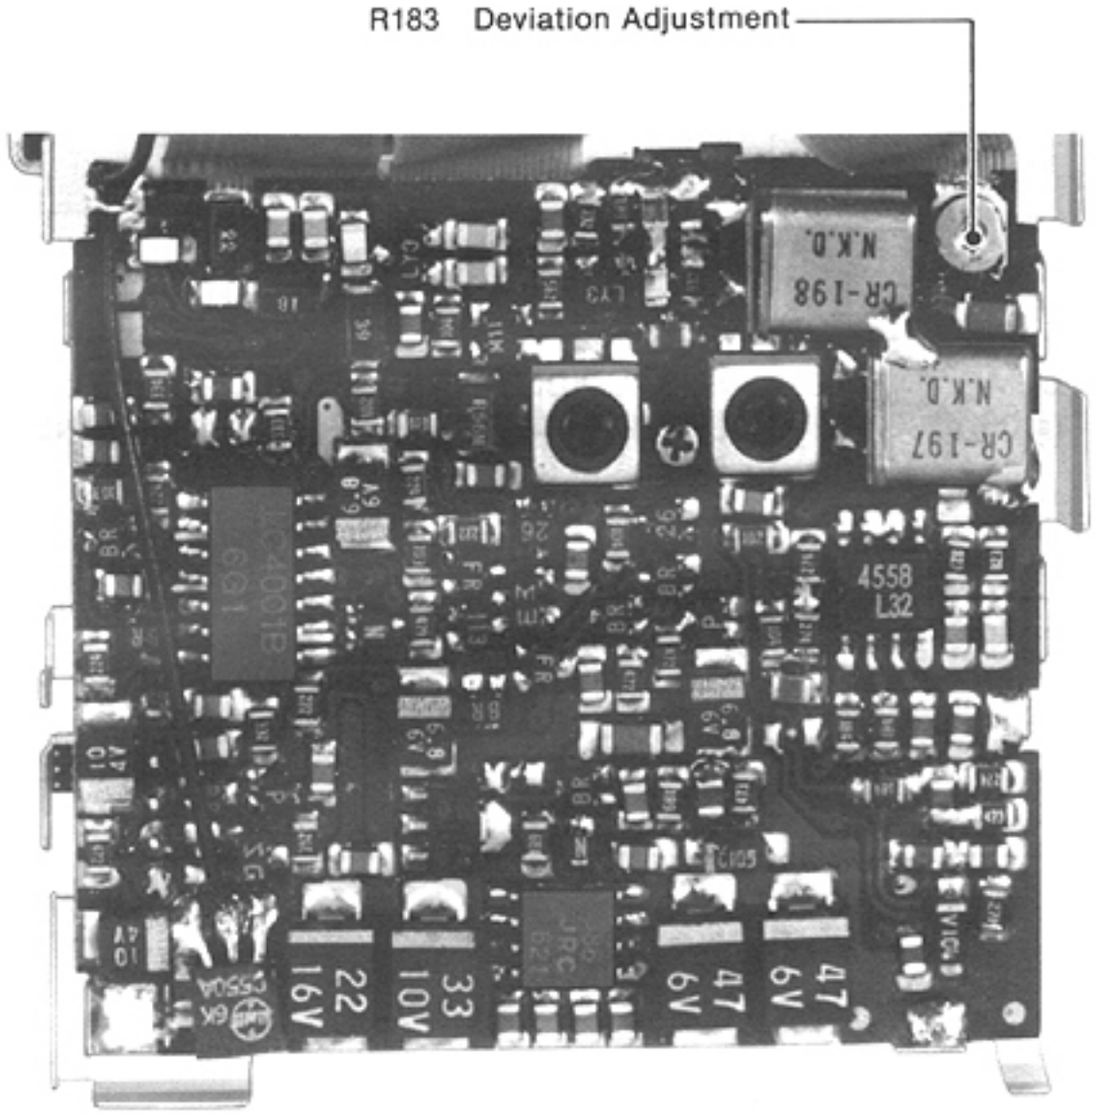


NOTE: For complete part numbers, "300" must be added to each binary numeral on the RF UNIT.

UNIT LOCATION



MAIN UNIT (2)



6-5 SUBAUDIBLE TONE, DTMF AND TONE CALL ADJUSTMENT

TEST INSTRUMENTS REQUIRED	MEASUREMENT CONNECTION LOCATION
(1) AC POWER SUPPLY • Output voltage : 8.4V DC (#04, #05) 9.0V DC (#09) • Current capacity : 2A or more (2) FM DEVIATION METER • Frequency minimum : 500MHz • Measuring range : 0~±5kHz	
ADJUSTMENT		ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
			UNIT	LOCATION		UNIT	ADJUST
SUBAUDIBLE TONE (#05, #09)	1	• Frequency display: 445.00MHz (#05) 435.00MHz (#09) • RF OUTPUT POWER SELECTOR SWITCH: HIGH • SIMPLEX/DUPLEX SELECTOR SWITCH: SIM • S701 P4: ON P7: ON • SUBAUDIBLE TONE ON/OFF SWITCH: ON (#05 only) • Apply no AF signal to the EXT. MIC JACK. • FM deviation meter HPF : OFF LPF : 20kHz De-emphasis : OFF Deviation sense: P-P/2 • Transmit mode	TOP PANEL	Connect an FM deviation meter to the ANTENNA CONNECTOR through an attenuator.	±0.75kHz	TONE	R701
		NOTE: After adjustment, turn P7 of S701 OFF.					
DTMF (#05, #09)	1	• SUBAUDIBLE TONE ON/OFF SWITCH: OFF • Push and hold the PTT SWITCH and "D" key.	TOP PANEL	Connect an FM deviation meter to the ANTENNA CONNECTOR through an attenuator.	±3.5kHz	DTMF	R602
TONE CALL (#04)	1	• Frequency display: 435.00MHz • TONE CALL SWITCH: ON			±3.5kHz	TONE CALL	R801
