NOTE: Circuit and ratings may change without notice due to developments in technology.

\* Will transmit on the new 30, 17, and 12 meter bands. Diodes installed for preventing accidental transmission before government amateur authorization.

## CIRCUIT DESCRIPTION

Features added from former TS-120S,V are as follows;

1. The three new HF bands (receive only).

Band	Receive frequency
10	10.0~10.25MHz
18	18.0~18.5MHz
24.5	24.5~25.0MHz

(Note) Receives WWV on 10MHz.

2. 20dB RF attenuator

3. 2-position selectivity (receive only).

1) Optional filters available.

Optional filter	-6dB bandwidth
YK-88SN SSB narrow filter	1.8kHz
YK-88C CW filter	500Hz
YK-88CN CW narrow filter	270Hz

(Note) YK-88S (-6 dB bandwidth:2.4kHz) is installed at the factory.

2) -6dB bandwidth with various optional filters.

No.	Filter	MODE		SSB	
		CW		WIDE	NARROW
1)	YK-88S only (installed at factory)	2.4kHz	*	2.4kHz	*
2)	YK-88C or YK-88CN	2.4kHz	500Hz or 270Hz	2.4kHz	*
3)	YK-88SN	2.4kHz	1.8kHz	2.4kHz	1.8kHz
4)	YK-88C or YK-88CN, YK-88SN	2.4kHz	500Hz or 270Hz	2.4kHz	1.8kHz

- (Note) 1. \*: No receive.  
 2. Jumper wire on the IF unit should be changed in No. 2 and No.4 Position.  
 3. YK-88S is always used in transmit.

## CIRCUIT DESCRIPTION

### SPEECH PROCESSOR CIRCUIT (X54-1550-00)

The AGC-type speech processor is composed of Q2:μPC1158H2, Q3:2SC1815(Y) and D3:1N60.

The audio signal amplified by Q18 on the AF-GEN unit goes through diode switch D1:1S1555 to the MIC control when the processor switch is OFF. When the processor switch is ON the audio signal, which is compressed and gains talk-power by the speech processor circuit, goes through D2:1S1555 to the MIC control. Q1(V type) or Q11 (S type):2SK30A on the filter unit is cut off when the processor switch is ON to shorten the ALC time constant to increase the average RF output power.

### TS-130 FREQUENCY SYSTEM

The TS-130 employs single conversion with a unique PLL circuit, as shown in Fig.1.

The frequency system is basically that of the TS-820 with the exception of the PLL circuit.

### PLL CIRCUIT

Fig. 2 shows PLL circuit construction and Table 4 shows the frequency in each circuit.

Referring to Fig.1, MIX (3) combines CAR and VFO signals and is operated straight through to mixer (1) on 3.5, 7 and 10 MHz. MIX (2) operates at 14 MHz and above with the output of MIX (3) to provide mixer (1) input, as shown in Table 4. MIX (1) output is filtered, amplified, shaped and divided by the programmable divider to obtain 500kHz output.

# CIRCUIT DESCRIPTION

The programmable divider converts the information from the band switch into a BCD signal in the counter. By presetting, the signal is divided at the ratio shown in Table 4. The phase comparator is a Motorola MC4044P. The loop filter amplifier, component transistors, minimizes unwanted spurious signal. If output of the phase comparator unlocks for any reason, VCO output is switched off to prevent out of band emission and, simultaneously the digital display blanks

## CAR OSCILLATOR

The CAR oscillator contains one oscillator and two crystals for LSB, USB and CW operation. The oscillator frequency in each mode is listed in Fig. 1.

Oscillator frequency can be varied by the IF SHIFT control during reception.

## VFO OSCILLATOR

The TS-130 VFO has same circuit and gear ass'y as the VFO-830. An LED indicator for VFO and FIX operation has been added.

## DIGITAL COUNTER

The TS-130 digital counter employs a VFO frequency counting system as shown in Fig.3.

The VFO frequency is mixed with a 5MHz signal obtained from the reference oscillator chain by a 3SK73 (Q7) and is converted to a 0.5MHz to 1MHz signal. This signal passes through the LPF, is amplified, buffered and shaped into a square wave, passes through the 0.1 second gate circuit and is applied to the 7-digit counter. The signal is counted from 10Hz to 10MHz.

The 100kHz, 1MHz and 10MHz order digits are preset by diode matrix operating on bandswitch information.

Fig. 2 TS-130 PLL circuit configuration

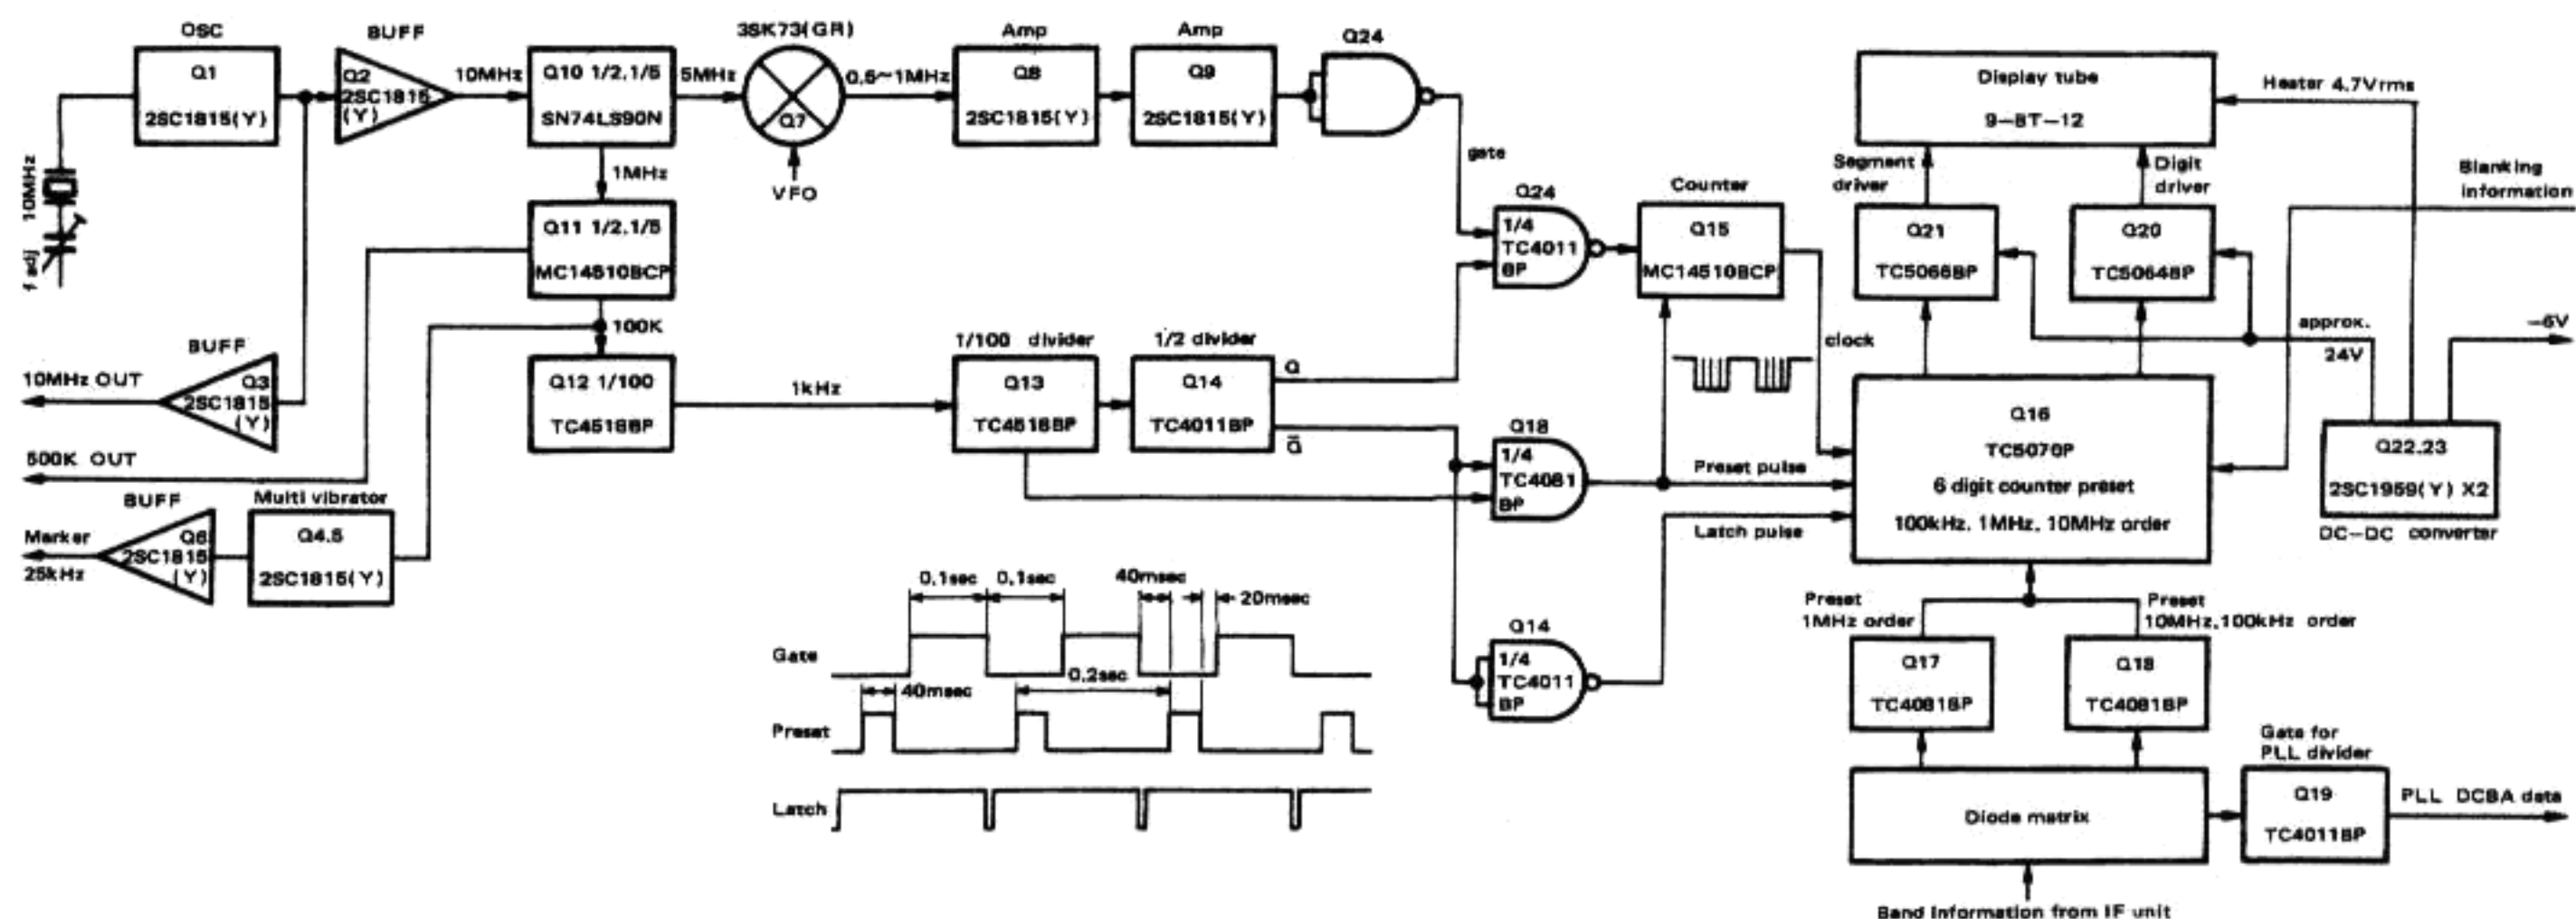

Fig. 3 TS-130 Counter unit block diagram

## CIRCUIT DESCRIPTION/SPECIAL COMPONENTS DATA

The 10MHz signal from the time-base reference oscillator is divided to produce gate, latch, and reset pulses which are fed to the counter. The 10 MHz and 500kHz signals are fed to the PLL circuit.

The marker circuit produces a 100kHz signal which synchronizes the 25kHz multivibrator to obtain a marker signal as accurate as the reference frequency. The analog dial can be accurately calibrated to the marker signal.

The 1/10 division at the first-stage count-down chain uses low-power Schottky TTL, while the remaining divisions are made by a CMOS IC for low power consumption and minimum spurious emission.

Because of the IF SHIFT circuit, the CAR frequency is independent of the transmit/receive frequency. Once the VFO frequency is counted, the operating frequency is indicated as accurately as the 10 MHz reference oscillator frequency is calibrated to WWV. Operating frequency is indicated accurate to the 100Hz order, regardless of the band or mode.

### PROTECTION CIRCUIT

When the transmit output load varies, the toroid in the final circuit samples reflected power. It is then rectified and amplified, producing a protection voltage to control the 2SK19 (Q12) on the AF-GEN unit, so transmitter output is continuously reduced.

### FILTER UNIT

#### 1. ALC: Protection circuit (VSWR)

The protection voltage picked up by L18 (S type), L11 (V type) in the filter unit is amplified by Q1 (S type), Q2 (V type) (2SC1815), then applied to the ALC line to control the output voltage.

#### 2. Fan drive circuit (S type)

The output of the thermistor TH3 detecting the temperature of the final unit is applied to Q6 (2SA562) via Q7 and Q8, so that Q6 is switched to operate the fan. The fan starts to rotate at about 45°C although the operating range shown in specification is 30~60°C. It stops when the temperature drops to a level 5~15°C lower than the start temperature. This circuit operates regardless of transmission or reception because it detects the temperature of the heat sink.

#### 3. AVR circuit

The 11V AVR consists of Q4, Q5 and Q6 (V type), Q4, Q5 and Q10 (S type). The regulated voltage is supplied to every unit except for the fan drive circuit during transmission. The fan drive circuit is always supplied with the regulated voltage regardless of transmission or reception.

#### 4. Filter circuit

The filter is a 2-stage constant K filter (3-stage for 3.5 MHz band). When the processor switch is ON Q1 (V type) or Q11 (S type) is cut off to shorten the ALC time constant.

### FINAL UNIT

#### 1. Temperature protection (S type)

1. Core temperature protection  
operates when the output transformer temperature exceeds 120°C. It recovers at approx. 80 to 110°C.
  2. Operates when the heat sink temperature exceeds 90°C. It recovers at approx. 50 to 80°C.
- When either of the above protection systems operate, the RL circuit in the AF-GEN unit is turned OFF and the unit is forcibly placed in the reception mode and transmission is inhibited. The protection circuit automatically recovers when the temperature drops to the normal level (i.e., the temperature drops by about 40°C).

#### 2. Temperature detection by the fan drive circuit (S type)

The heat sink temperature is detected by the thermistor TH3 to control fan operation.

PARTS LIST

Note 1:

K. U.S.A T Britain W Europe X Australia

Note 2:

Only special type of resistors (example: cement, metal film, etc.) and capacitors (example: electrolytic, tantalum, mylar, temp. coeff. capacitors) are detailed in the PARTS LIST. For the value of all common type components, refer to the schematic diagram of the P.C. board illustration. Resistors not otherwise detailed are carbon type 1/4W or 1/8W. Order carbon resistors and capacitors according to the following example:

A carbon resistor's part number is RD14BY 2E222J

A ceramic capacitor's number is CK45F1H103Z, CC45TH1H220J

RECEIVER SECTION

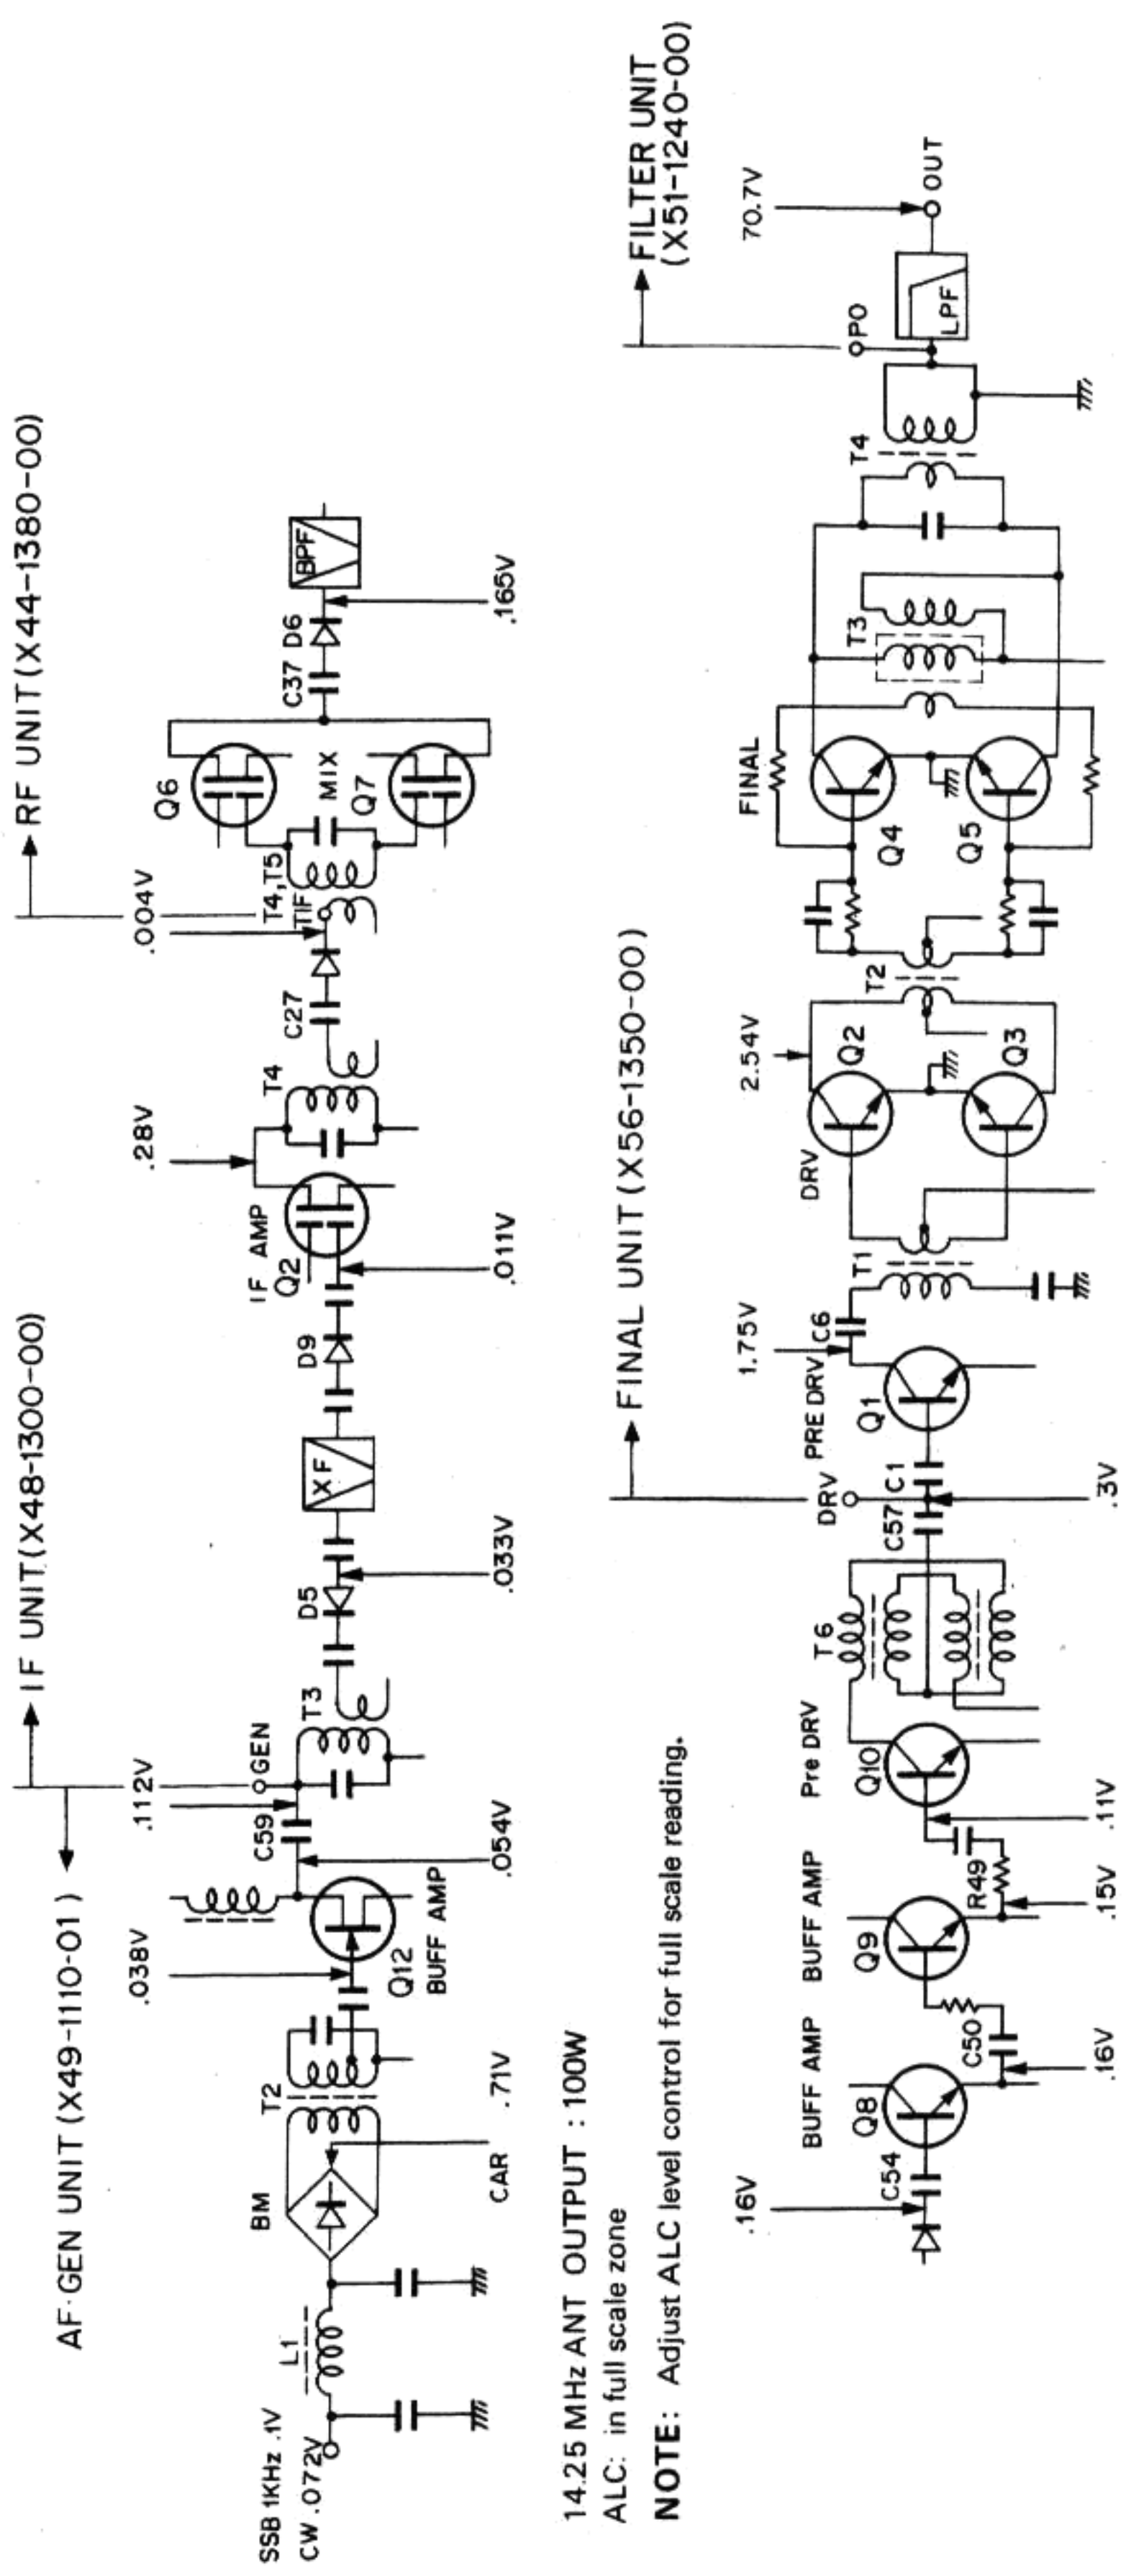

**NOTES:**  
 FREQUENCY: 14.250 MHz  
 INPUT: 0 dB (.5 μV)  
 AF OUTPUT: 0.63V at 8Ω

- 1) The figures shown are signal generator output required for a constant audio output with a constant AF gain control setting. Set the AF gain control for 0.63V/8Ω (50 mW) audio output at 0 dB signal generator input at 14.250 MHz.
- 2) All voltage measurements are read from an RF VTVM.
- 3) To measure signal generator output connect a 0.01 μF 500 WV capacitor between the signal generator and the check point.

14.25 MHz ANT OUTPUT : 100W  
 ALC: in full scale zone  
**NOTE:** Adjust ALC level control for full scale reading.

## ADJUSTMENTS

### GENERAL

Adjustment procedures for this transceiver are classified into formal adjustments requiring a full service bench and simplified adjustment using a VTVM, AF and RF VTVM, AG, and AF and RF dummy load. Complete adjustment also requires a frequency counter, SSG, sweep generator, etc.

### TEST EQUIPMENT REQUIRED

#### 1. VTVM or DVM

- 1) Input resistance: More than 1M $\Omega$
- 2) Voltage range: 1.5 to 1000V AC/DC

NOTE : A high-precision voltmeter may be used. However, accurate readings can not be obtained for high-impedance circuits.

#### 2. DC current meter

- 1) Current range: 100mA, 200mA, 2A, 10A, High-precision current meter may be used.

#### 3. RF VTVM

- 1) Input impedance: 1M $\Omega$  and less than 3 pF, min.
- 2) Voltage range: 10mV to 300V
- 3) Frequency range: 50MHz or greater

NOTE: During adjustment special accuracy is not required (such as input level or PLL circuit carrier oscillator output), a VTVM or VOM may substitute for an RF VTVM by measuring through the output of a detector as shown in item 14.

#### 4. AF VTVM

- 1) Frequency range: 50Hz to 10kHz
- 2) Input resistance: 1M $\Omega$  or greater
- 3) Voltage range: 10mV to 30V

#### 5. AF GENERATOR (AG)

- 1) Frequency range: 200Hz to 5kHz
- 2) Output: 2mV~1V, low distortion

#### 6. AF DUMMY LOAD

- 1) Impedance: 8 $\Omega$
- 2) Dissipation: 3W or greater

#### 7. RF DUMMY LOAD

- 1) Impedance: 50 $\Omega$ , 150 $\Omega$
- 2) Dissipation: 100W continuous or greater
- 3) Frequency limits: 1.8 to 30MHz

The above-mentioned instruments may be used for simplified adjustment. For complete, precise adjustment, the following instruments are also necessary.

#### 8. OSCILLOSCOPE

Requires high sensitivity, and external synchronization capability.

#### 9. SWEEP GENERATOR

- 1) Center frequency: 8.83MHz
- 2) Frequency deviation: Maximum  $\pm 5$ kHz
- 3) Output voltage: More than 0.1V
- 4) Sweep rate: At least 0.5 sec/cm

#### 10. Standard Signal Generator (SSG)

- 1) Frequency range: 1.8 to 30MHz
- 2) Output: -20dB/0.1 $\mu$ V~120dB/1V

NOTE: Generator must be frequency stable.

#### 11. FREQUENCY COUNTER

- 1) Minimum input voltage: 50mV
- 2) Frequency range: Greater than 40MHz

#### 12. NOISE GENERATOR

Must generate ignition noise containing harmonics beyond 30MHz.

#### 13. Spectrum analyzer

- 1) Frequency range: 100K to 110MHz
- 2) Bandwidth: 1kHz to 3MHz

NOTE: R-1000 receiver may be used.

#### 14. Detector

- 1) For adjustment of TX BPF

- 2) For adjustment of PLL unit BPF

#### 15. Directional coupler

#### 16. FIX-CH adjusting crystal element

- 1) 5.750MHz (center: 250kHz)

Output voltage	. . . . .	.02V $\pm$ 1dB (across 470-ohm load)
Frequency stability	. . . . .	Within 100Hz per 30 minutes after 3 minutes warm-up (at room temperature).
Solid-state complement	. . . . .	FET : 2 Transistor : 2 Diode : 6
Power source	. . . . .	From TS-120/TS-130
Dimensions	. . . . .	.123(4-7/8)W X 96(3-13/16) H-X 235(9-1/4) D mm (inches)
Weight	. . . . .	.2.5kg(3.5lbs)

NOTE: The circuit and ratings may change without notice due to developments in technology
