ICOM

SERVICE MANUAL

HF/50MHz TRANSCEIVER

IC-729

Icom Inc.

INTRODUCTION

This service manual describes the latest service information for the **IC-729** HF/50 MHz TRANSCEIVER at the time of publication.

VERSION NO.	VERSION	SYMBOL
#02	General	OTH
#03	France	FRA

To upgrade quality, all electrical or mechanical parts and internal circuits are subject to change without notice or obligation.

DANGER

NEVER connect the transceiver to an AC outlet or to a DC power supply that uses more than 16 V. This will ruin the transceiver.

DO NOT expose the transceiver to rain, snow or any liquids.

DO NOT reverse the polarities of the power supply when connecting the transceiver.

DO NOT apply an RF signal of more than 20 dBm (100 mW) to the antenna connector. This could damage the transceiver's front end.

ORDERING PARTS

Be sure to include the following four points when ordering replacement parts:

1. 10-digit order numbers
2. Component part number and name
3. Equipment model name and unit name
4. Quantity required

<SAMPLE ORDER>

1790000050	IC	ND487C1-3R	IC-729	MAIN UNIT	5 pieces
8810002160	Screw	FH M3 × 5	IC-729	Chassis	10 pieces

Addresses are provided on the inside back cover for your convenience.

REPAIR NOTES

1. Make sure a problem is internal before disassembling the transceiver.
2. **DO NOT** open the transceiver until the transceiver is disconnected from its power source.
3. **DO NOT** force any of the variable components. Turn them slowly and smoothly.
4. **DO NOT** short any circuits or electronic parts. An insulated tuning tool **MUST** be used for all adjustments.
5. **DO NOT** keep power ON for a long time when the transceiver is defective.
6. **DO NOT** transmit power into a signal generator or a sweep generator.
7. **ALWAYS** connect a 50 dB~60 dB attenuator between the transceiver and a deviation meter or spectrum analyzer when using such test equipment.
8. **READ** the instructions of test equipment thoroughly before connecting equipment to the transceiver.

TABLE OF CONTENTS

SECTION 1 SPECIFICATIONS

■ GENERAL

• Frequency coverage	:	Receive	500 kHz~30 MHz	50 MHz~54 MHz
		Transmit	1.800~1.99999 MHz	18.068~18.168 MHz
			3.500~4.000 MHz	21.000~21.450 MHz
			7.000~7.300 MHz	24.890~24.990 MHz
			10.100~10.150 MHz	28.000~29.700 MHz
			14.000~14.350 MHz	50.000~54.000 MHz
• Mode	:	SSB, CW, AM, FM		
• Number of memory channels	:	26		
• Antenna impedance	:	50 Ω nominal		
• Usable temperature range	:	−10 °C~+60 °C (+14 °F~+140 °F)		
• Frequency stability	:	Less than ±200 Hz from 1 min. to 60 min. after power ON.		
		Less than ±30 Hz/hr. after one hour at +25 °C (+77 °F).		
		Temperature fluctuations (0 °C ~+50 °C ; +32 °F~+122 °F) less than ±350 Hz		
• Power supply requirement	:	13.8 V DC±15 %		
• Curret drain (at 13.8 V DC)	:	Transmit	20 A	
		Receive squelched	1.3 A	
		max. audio output	1.6 A	
• Dimensions	:	241 (W) × 94 (H) × 239 (D) mm		
		9.5 (W) × 3.7 (H) × 9.4 (D) in		
		(Projections not included)		
• Weight	:	4.9 kg (10.8 lb)		

■ TRANSMITTER

• Output power :

MODE	1.8~29.7 MHz	50~54 MHz
SSB, CW, FM	10~100 W	1~10 W
AM	10~40 W	1~4 W

(continuously adjustable)

• Spurious emissions	:	1.8~29.7 MHz	Less than −50 dB
		50~54 MHz	Less than −60 dB
• Carrier suppression	:	More than 40 dB	
• Unwanted sideband suppression	:	More than 50 dB	
• Microphone impedance	:	600 Ω	

■ RECEIVER

• Receive system	:	Triple-conversion superheterodyne		
• Intermediate frequencies	:			

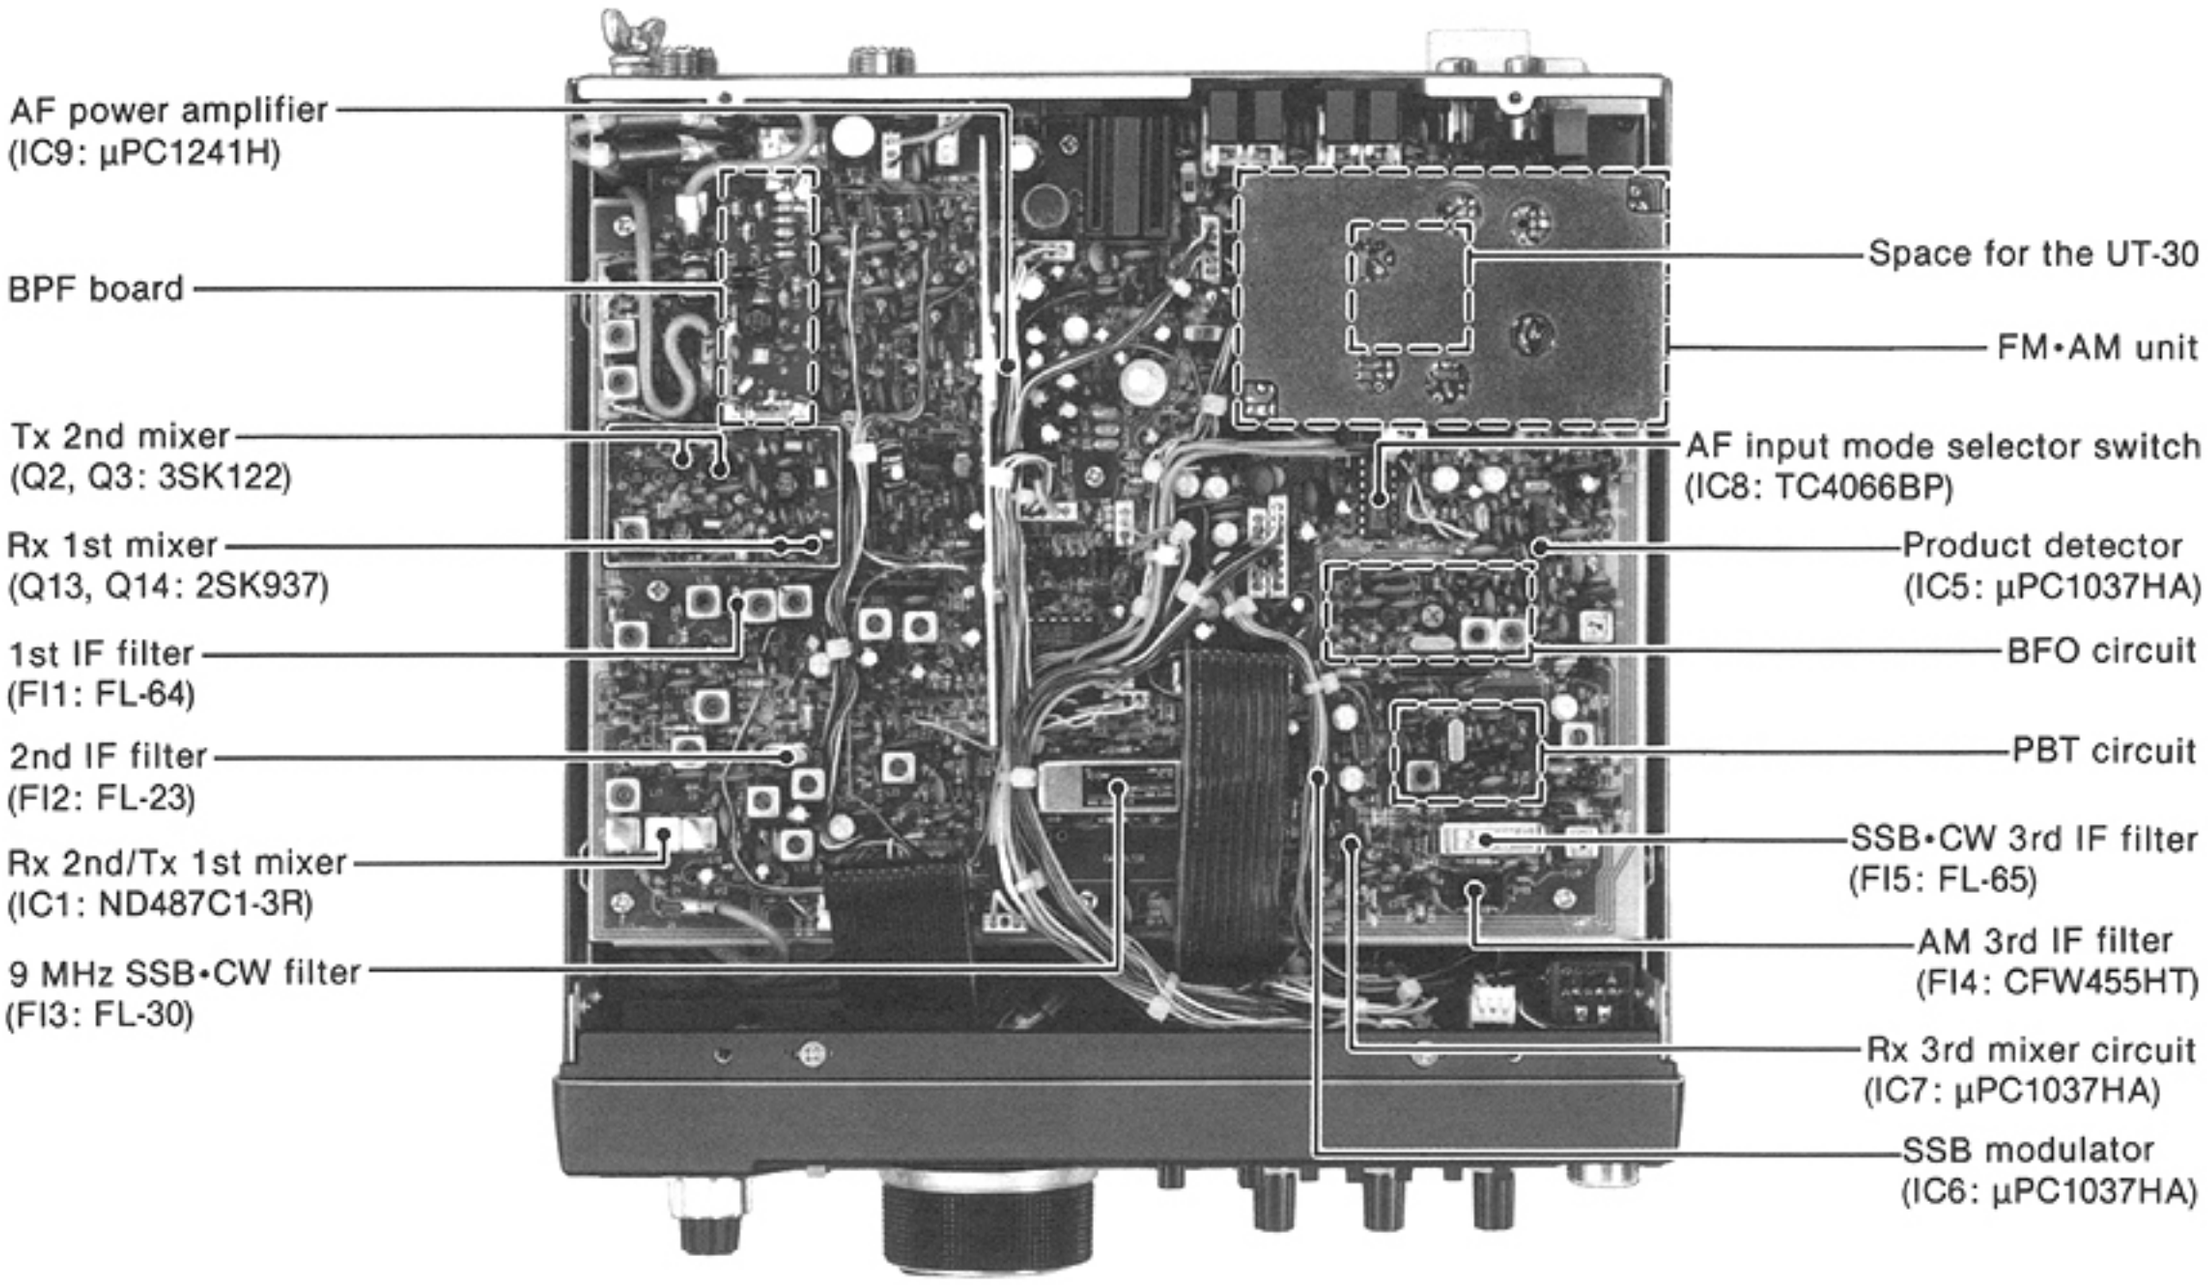
MODE	1st	2nd	3rd
SSB	70.4515 MHz	9.0115 MHz	455 kHz
CW	70.4506 MHz	9.0106 MHz	455 kHz
AM, FM	70.4500 MHz	9.0100 MHz	455 kHz

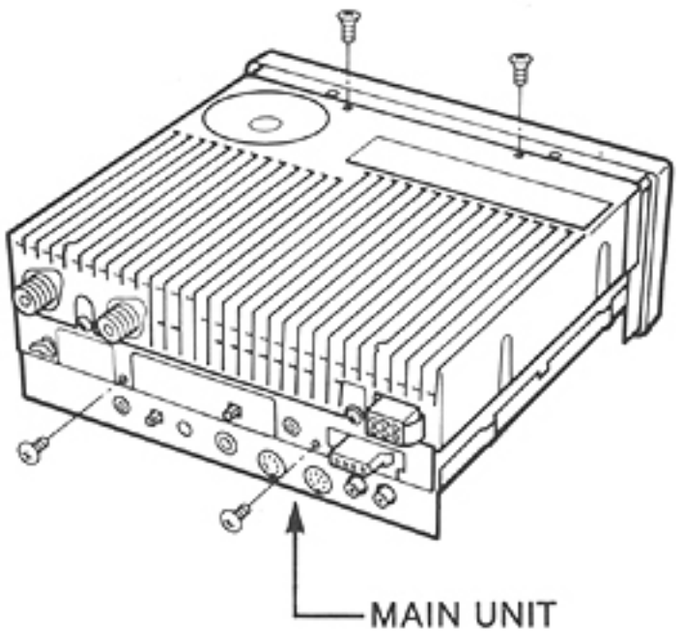
• Sensitivity (Preamp ON)	:	SSB, CW (10 dB S/N)	1.8~30 MHz	Less than 0.16 μV
			50~54 MHz	Less than 0.13 μV
		AM (10 dB S/N)	0.5~1.8 MHz	Less than 13.0 μV
			1.8~30 MHz	Less than 2.0 μV
			50~54 MHz	Less than 2.0 μV
		FM (12 dB SINAD)	28~30 MHz	Less than 0.5 μV
			50~54 MHz	Less than 0.3 μV
• FM squelch sensitivity	:	Less than 0.3 μV		
• Selectivity	:	SSB, CW	More than	2.1 kHz/−6 dB Less than 4.0 kHz/−60 dB
		AM	More than	6.0 kHz/−6 dB Less than 20.0 kHz/−40 dB
		FM	More than	12.0 kHz/−6 dB Less than 30.0 kHz/−50 dB
• Spurious and image rejection ratio	:	More than 70 dB		
• Audio output power	:	More then 2.6 W with an 8 Ω load		
• RIT variable range	:	More than ±1.2 kHz		

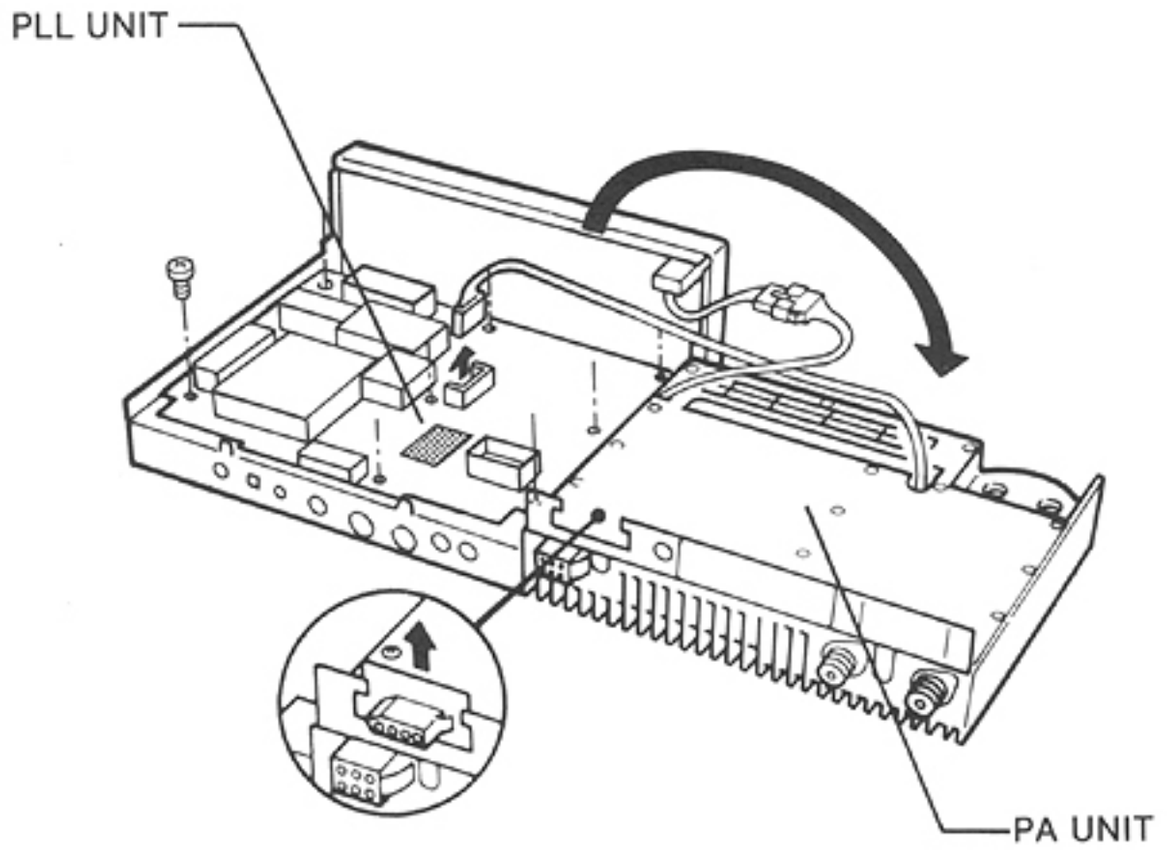
All stated specifications are approximate and subject to change without notice or obligaton.

SECTION 2 INSIDE VIEWS

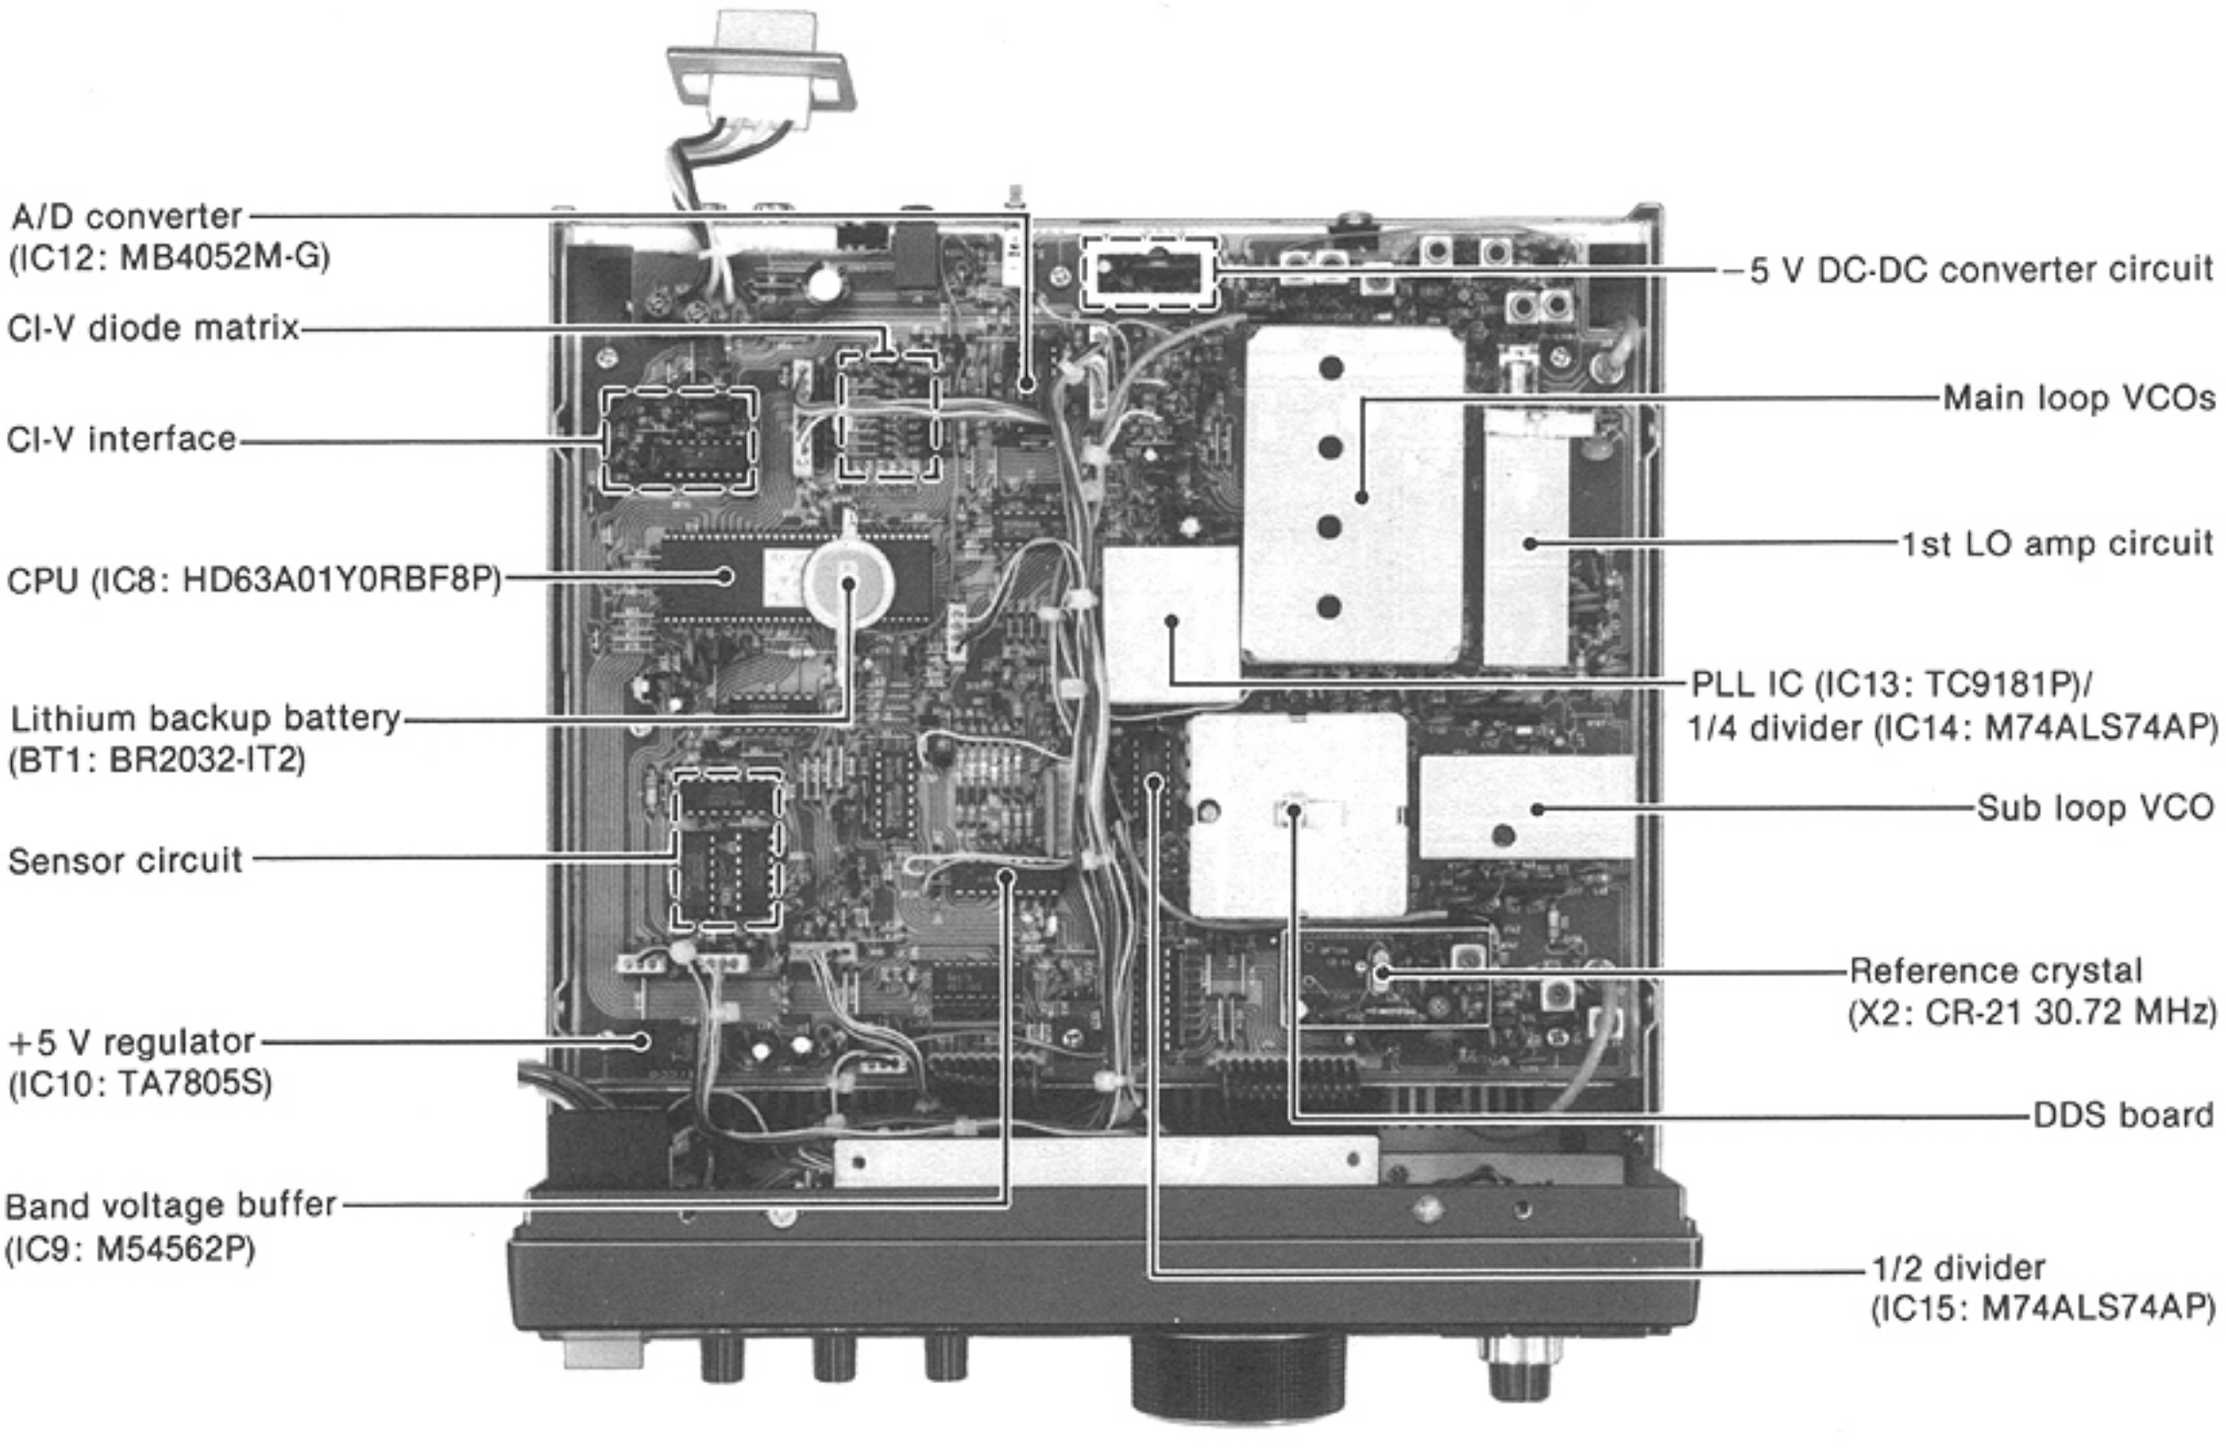
• MAIN UNIT



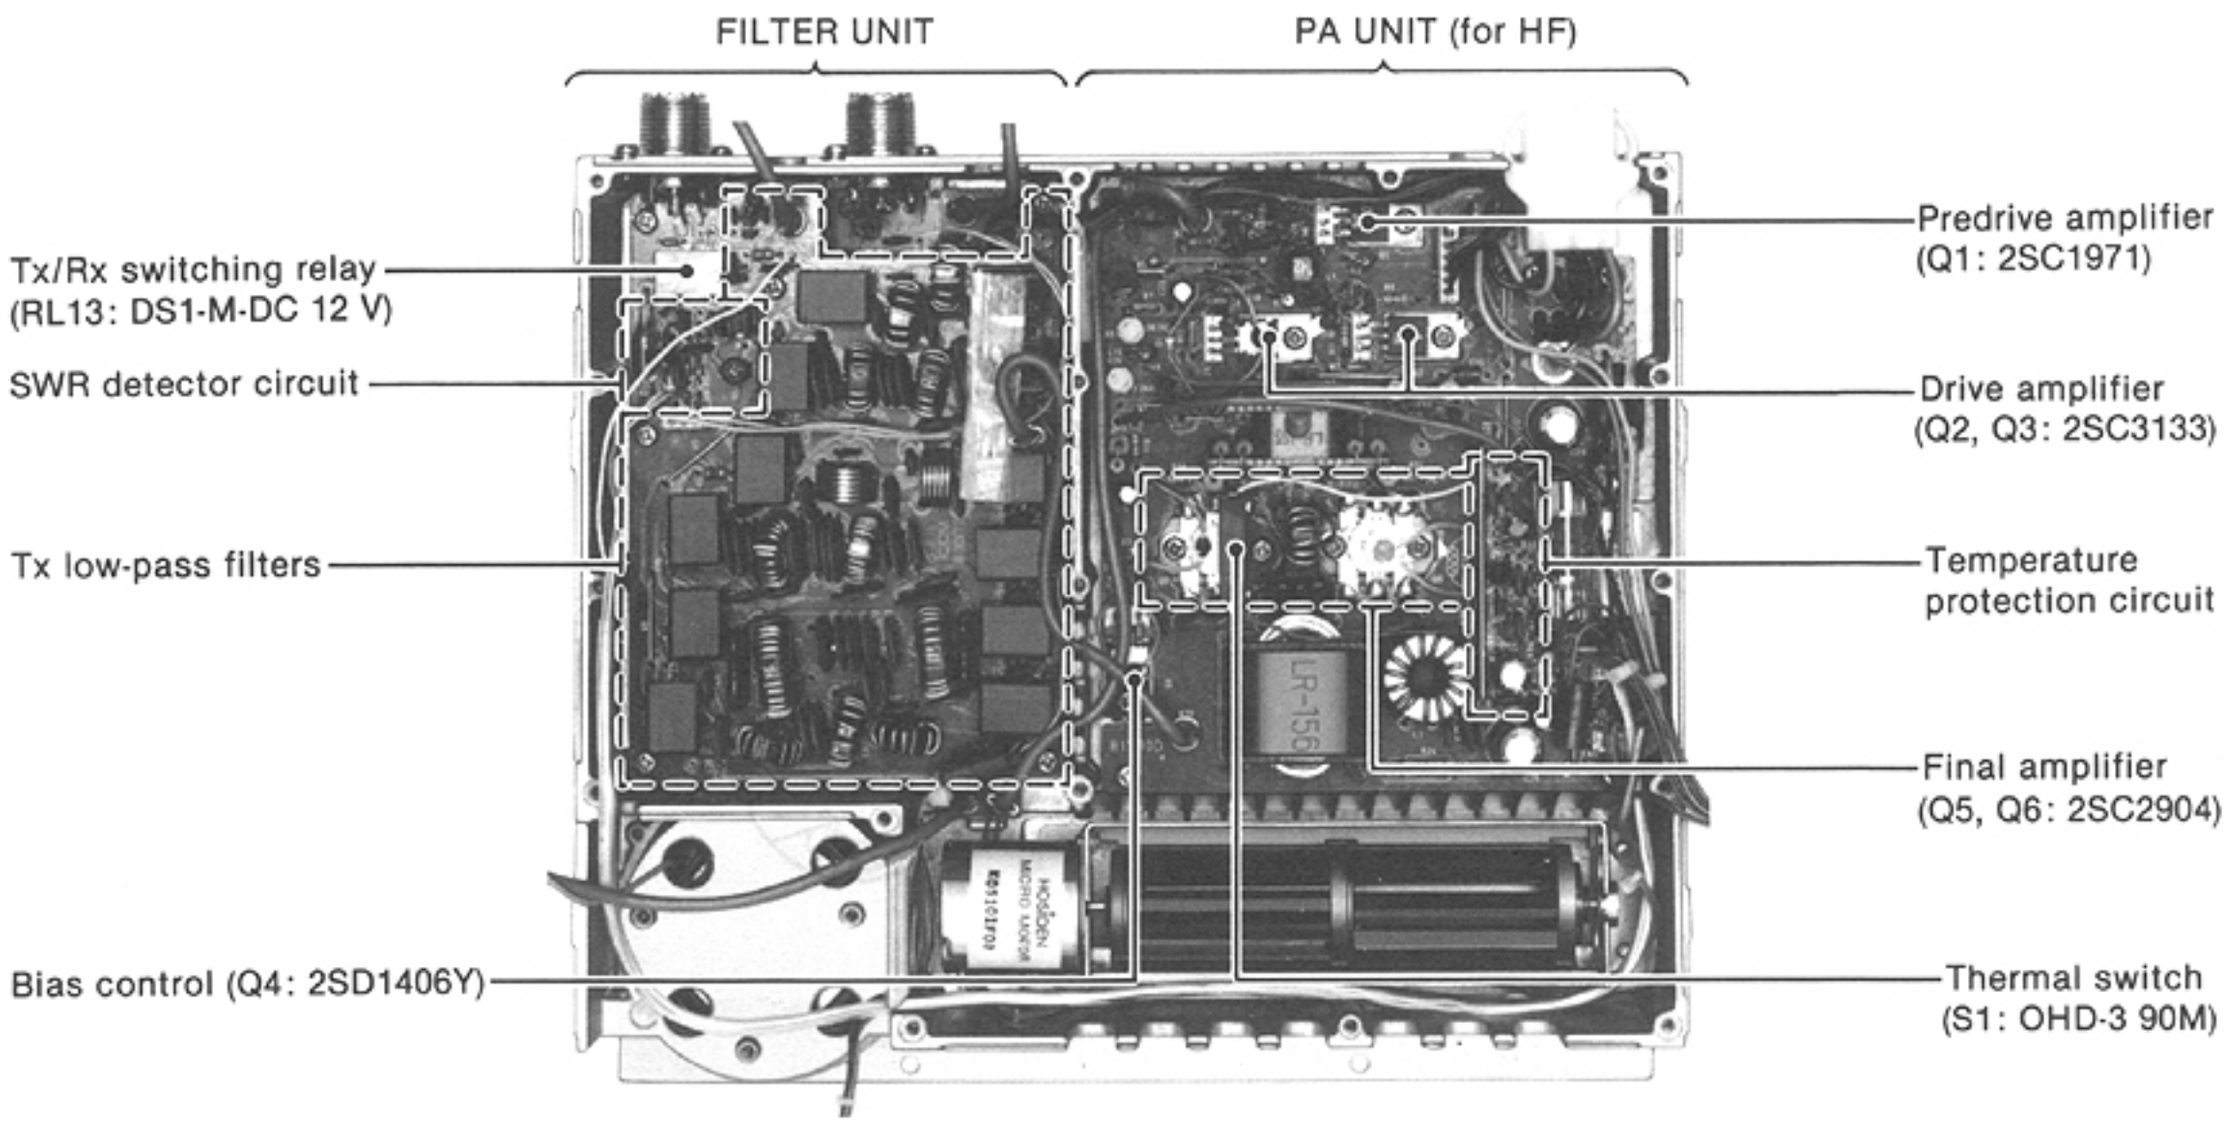




• PLL UNIT



• PA AND FILTER UNITS



PB unit (for 50 MHz) is located under the FILTER unit.

SECTION 3 CIRCUIT DESCRIPTION

3-1 RECEIVER CIRCUITS

3-1-1 HF SWITCHING CIRCUIT (FILTER AND MAIN UNITS)

The HF switching circuit leads receive signals to bandpass filters from the [HF ANT] connector while receiving. While transmitting, this circuit leads the signal from the HF power amplifier to the [HF ANT] connector. This circuit includes a 20 dB HF attenuator circuit to prevent distortion from very strong signals.

HF signals from the [HF ANT] connector pass through the transmit/receive switching relay (RL13) and low-pass filter (L26, C60~C62), and are then applied to the MAIN unit via P1 (MAIN unit: J12).

The signals from the FILTER unit are either bypassed or are attenuated at the 20 dB attenuator (R103, RL1). There are no non-linear components from the antenna connector to the attenuator in this circuit construction. Therefore the attenuator effectively prevents distortion caused by strong signals. The signals are then applied to HF bandpass filters.

3-1-2 HF BANDPASS FILTER CIRCUIT (MAIN UNIT)

HF bandpass filters pass only the desired band signals and suppress any undesired band signals.

The RF circuit has 7 RF bandpass filters (BPF) for signals above 1.6 MHz and 1 low-pass filter (LPF) for signals below 1.6 MHz. The signals pass through the low-pass or one of the bandpass filters depending on the frequency.

(1) 0.5~1.6 MHz

There is no diode at the low-pass filter (L38, L39, C148~C150) entrance so as to prevent distortion from very strong signals. The filtered signals bypass a preamplifier through a bypass switch (Q12) and are then applied to the 1st mixer circuit (Q13, Q14).

(2) 1.6~30.0 MHz

These signals pass through a high-pass filter (L42, L43, C143~C146) to suppress strong signals below 1.6 MHz, such as from broadcasting stations. The filtered signals are applied to one of 7 bandpass filters depending on the frequency and then applied to the preamplifier circuit.

USED RF FILTER

BAND	CONTROL SIGNAL	ENTRANCE DIODE	BAND	CONTROL SIGNAL	ENTRANCE DIODE
0.5~1.6 MHz	B0	–	8~11 MHz	B4	D44
1.6~2 MHz	B1	D38	11~15 MHz	B5	D46
2~4 MHz	B2	D40	15~22 MHz	B6	D48
4~8 MHz	B3	D42	22~30 MHz	B7	D50

3-1-3 50 MHz SWITCHING AND BANDPASS CIRCUIT (PB AND MAIN UNITS)

The 50 MHz switching circuit and 50 MHz bandpass filter adopt a diode switching system and an active bandpass filter respectively.

50 MHz signals from the [50M ANT] connector pass through the low-pass filter (L7~L10, C29~C37) and forward biased switching diodes (D5~D7) and are then applied to the MAIN unit via P5 (MAIN unit: J31). The switching diode (D4) is reverse biased while receiving, so that the 50M signals do not applied to the transmitter circuits.

50 MHz band signals which entered the MAIN unit pass through the HF/50M switching relay (RL1) and enter the BPF board. The signals are passed through the high-pass filter (L2, L3, C2~C4) and are then amplified to the 50M amplifier (Q1) on the BPF board. The signals are then passed to the HF signal line (last stage of the HF bandpass filter) to be applied to or bypass the preamplifier circuit.

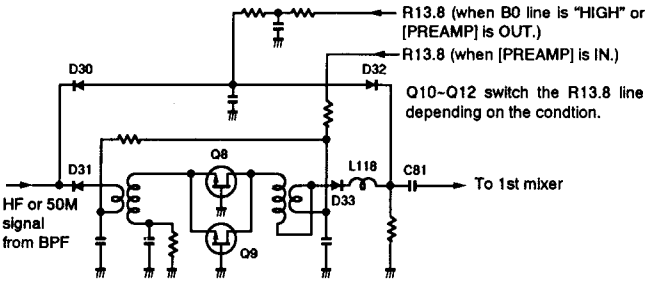
3-1-4 PREAMPLIFIER CIRCUIT (MAIN UNIT)

The preamplifier circuit uses two 2SK937s to obtain 10 dB gain over a wideband frequency range. When the [PREAMP] switch on the front panel is pushed IN, the signals above 1.6 MHz are applied to the preamplifier circuit.

Q8 and Q9 are connected in parallel to easily match the impedance to 50 Ω. Q10 and Q11 switch the signals from a bandpass filter, either to be bypassed, or to be applied to the preamplifier, depending on the [PREAMP] switch condition.

Amplified or bypassed signals are applied to the 1st mixer circuit (Q13, Q14).

PREAMP CIRCUIT



3-1-5 1ST MIXER CIRCUIT (MAIN UNIT)

The 1st mixer circuit mixes the receive signals with the 1st LO signal to convert the receive signal frequency to a 70 MHz 1st IF.

The signals from the preamplifier circuit, or signals which bypass the preamplifier, pass through a low-pass filter. This low-pass filter suppresses signals above 30 MHz to eliminate direct receiving of signals at 70 MHz and image interference at 140 MHz. Then the signals are applied to the 1st mixer (Q13, Q14).

The 1st LO signal (70.4800~100.4530 MHz for HF, or 120.4515~124.4515 MHz for 50 MHz) enters the MAIN unit from the PLL unit via J5. The LO signal is amplified at Q4, filtered by a low-pass filter, and then, applied to the 1st mixer. The low-pass filter uses a ring core inductor to prevent leakage of 1st LO signals. The output level from Q4 is approx. 15 dBm.

The 1st mixer (Q13, Q14) uses two 2SK937s to produce high level mixing with a high intercept point.

EXACT 1ST IF FREQUENCY

MODE	FREQUENCY (MHz)
SSB	70.4515
CW	70.4506
AM. FM	70.4500

3-1-6 1ST IF CIRCUIT (MAIN UNIT)

The 1st IF circuit filters and amplifies the 1st IF signals. The 1st IF signals from the 1st mixer circuit are applied to MCF (Monolithic Crystal Filter; FI1) to suppress out-of-band signals. The filtered signals are applied to the 1st IF amplifier (Q15). AGC is supplied to the 2nd gate of Q15.

3-1-7 2ND MIXER CIRCUIT (MAIN UNIT)

The 2nd mixer circuit mixes the amplified 1st IF signals and 2nd LO signal (61.44 MHz) to convert the 1st IF to a 2nd IF.

The amplified 1st IF signals from Q15 are converted to a 9 MHz 2nd IF signal at the 2nd mixer (IC1). IC1 is a DBM (Double Balanced Mixer). The DBM uses a coil with a glass-type core to treat the LO at a 0 dBm level.

The 2nd IF signals are applied to FI2 to suppress undesired signals such as the 2nd LO signal, and then are applied to the noise blanker gate (D5~D8).

EXACT 2ND IF FREQUENCY

MODE	FREQUENCY (MHz)
SSB	9.0115
CW	9.0106
AM. FM	9.0100

3-1-8 NOISE BLANKER CIRCUIT (MAIN UNIT)

The noise blanker circuit detects pulse type noise, and turns OFF the signal line when noise appears.

The 2nd IF signals from FI2 are applied to the noise blanker gate (D5~D8). A portion of the signals from FI2 is amplified at the noise amplifiers (Q16, IC2), then detected at the noise detector (D12, D13). The detected signal from the noise detector is applied to the noise blanker switch (Q19).

A portion of the detected signal from the noise detector is applied to the noise AGC circuit (Q17, Q18, C60, R47) to control the bias voltage of the noise amplifier (IC2 pins 2, 3).

The threshold level of the noise blanker switch (Q19) is set to 0.9 V. When the detected voltage exceeds the threshold level, Q20 outputs a blanking signal to close the noise blanker gate (D5~D8), depending on the pulse noise period.

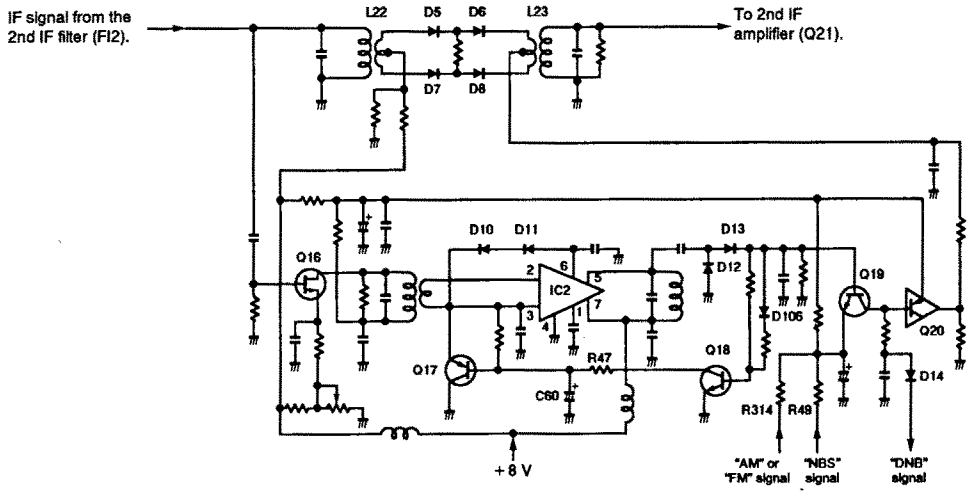
When the operating frequency is changed, the "DNB" signal line becomes "LOW," turning Q20 ON through D14. In this case, the noise blanker gate prevents PLL click noise.

3-1-9 2ND IF CIRCUIT (MAIN UNIT)

The 2nd IF circuit amplifies and filters the 2nd IF signals.

The signals passed through the noise blanker gate (D5~D8) are amplified at Q21. The Loose tuning circuit (L24, C47) matches the signals to the 2nd IF filters.

NOISE BLANKER CIRCUIT



When SSB or CW mode is selected, the signals pass through FI3 (FL-30) via D15. When an optional CW narrow filter is installed and CW-N mode is selected, signals pass through the CW narrow filter via D25. When AM mode is selected, the signals bypass the 2nd IF filter via D20. When FM mode is selected, the signals are applied to the FM•AM unit via D52.

The filters are selected with mode selecting signals (SSB•CW, AM, CW-N) and the "T8" voltage line.

Signals from a filter are applied to the 3rd mixer (IC7) through D63.

3-1-10 3RD MIXER AND 3RD IF CIRCUITS (MAIN UNIT)

The 3rd mixer circuit mixes the filtered 2nd IF signals and the 3rd LO signal to convert the 2nd IF to a 3rd IF.

The 2nd IF signals from D63 are converted to a 455 kHz 3rd IF signal at the 3rd mixer (IC7). The 3rd IF signal is applied to FI4 (for AM mode) or FI5 (for SSB and CW mode). The filters are selected by the mode selecting signals. The filtered signal is amplified at Q27, Q28 and Q29 to obtain a detectable level.

A rapid time constant of AGC is used for Q27 to prevent rising edge distortion of receive signals. Thermistors (R417, R419), connected to Q27, Q28 respectively, improves the temperature characteristics of the receiver gain. R138 adjusts the receiver gain. Q29 is a buffer amplifier and output signals from Q29 are shared between the SSB/CW detector, AM detector and AGC detector.

3-1-11 BFO CIRCUIT (MAIN UNIT)

A 9 MHz signal oscillated at the BFO circuit (Q31, X1) is buffer-amplified at Q42 and applied to the balanced modulator (IC6) for transmission and to a product detector (IC5) after mixing with the 3rd LO signal at IC12 for receive demodulation.

In USB mode, the "USB" signal line becomes "HIGH," turning D69 ON. The frequency is then adjusted with C294 to set the USB carrier point.

During CW transmission, the "CW" signal line becomes "HIGH" turning D68 ON. The frequency is then adjusted with L83 to set the CW transmit carrier point.

In LSB mode, the "LSB" signal line becomes "HIGH," turning D67 ON. The frequency is then adjusted with L82 to set the LSB carrier point.

During CW reception, R8 voltage turns Q33 ON, then switching diodes (D67~D69) are turned OFF. The frequency is fixed by coils (L81~L83) and capacitors (C294, C230).

BFO FREQUENCY IN EACH MODE

MODE	FREQUENCY (MHz)
USB	9.0130
CW (Tx)	9.0106
LSB	9.0100
CW (Rx)	9.0098
AM	NO OUTPUT

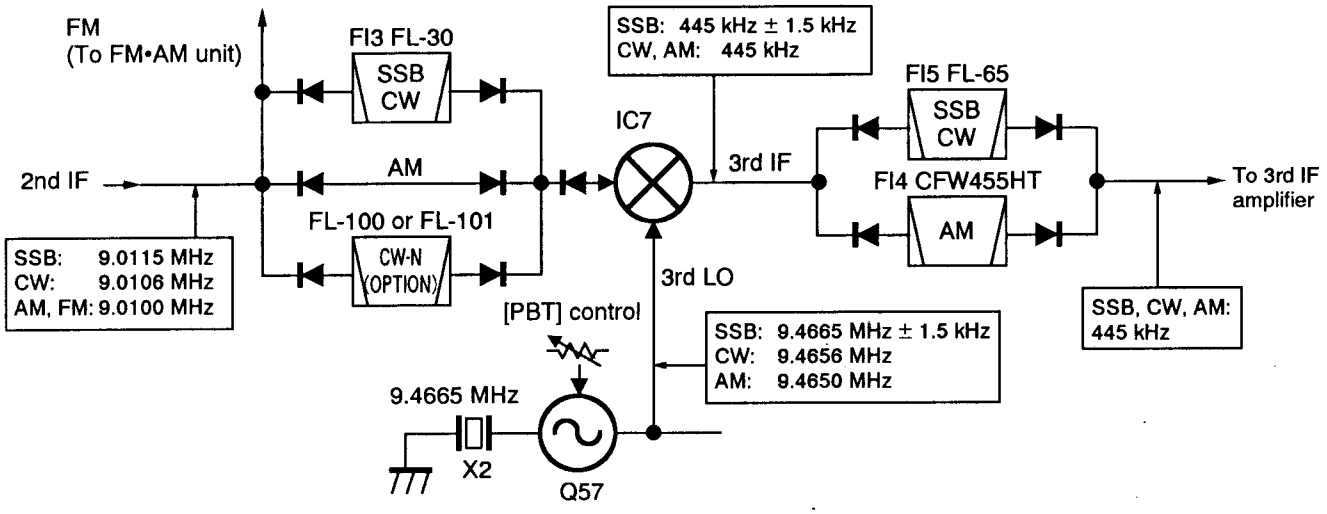
3-1-12 PBT CIRCUIT (MAIN UNIT)

The PBT circuit shifts the 3rd IF within ±1.5 kHz. As a result, the 3rd IF is shifted from the center frequency of the 3rd IF filter (FI5). This means the 3rd IF signal does not pass through the center of the 3rd IF filter because the passband width is fixed in the 2nd IF filter. Therefore, the overlap of the 2nd and 3rd IF filters appears to be narrowed.

Since the BFO frequency is also shifted the same value as the 3rd IF shift, frequency is corrected at the detector.

The 3rd LO to IC7 is produced by Q57 and X2. X2 is shifted ± 1.5 kHz by D101 in SSB mode. Therefore, the 3rd LO is shifted to activate the PBT.

PBT CIRCUIT



In AM mode, D101 variable voltage is replaced with a preset voltage by Q62 and 9.4650 MHz is output regardless of the [PBT] control location.

In CW mode, D101 variable voltage is replaced with a preset voltage by Q60 and 9.4656 MHz is output regardless of the [PBT] control location.

3-1-13 SSB/CW DEMODULATOR CIRCUITS (MAIN UNIT)

In SSB or CW mode, the 3rd IF signal from the IF amplifier (Q29) is mixed with the BFO signal from IC12 at the product detector (IC5) to demodulate the 3rd IF signal into an AF signal. The detected signal (AF) from IC5 (pin 2) is applied to the AF input mode selector switch (IC8).

3-1-14 AM DEMODULATOR CIRCUITS (MAIN UNIT)

In AM mode, the 3rd IF signal from the IF amplifier (Q29) passes through C121 and is detected at D62. The detected signal (AF) is then applied to the AF input mode selector switch (IC8).

3-1-15 FM DEMODULATOR CIRCUIT (FM•AM UNIT)

In FM mode, the 2nd IF signal, just before passing the 2nd IF filter, is applied to the FM•AM unit via D52. The passed signal is applied to the FM IF IC where the IF signal is converted into the 3rd IF signal and is then converted into AF signals.

X1 and X2 on the FM•AM unit are used for the 3rd local oscillator and quadrature detector, respectively.

The detected signal (AF) is then applied to the AF input mode selector switch (IC8) on the MAIN unit.

3-1-16 AF INPUT MODE SELECTOR SWITCH (MAIN UNIT)

The AF signal from one of detector circuits is applied to the AF input mode selector switch (IC8). IC8 consists of 4 analog switches which are selected with a mode signal and the squelch control signal. The AF signal is output from IC8 (pins 1, 4, 11) and then applied to the AF amplifier circuit.

3-1-17 AGC CIRCUIT (MAIN UNIT)

The AGC (Automatic Gain Control) circuit reduces IF amplifier gain to keep the audio output at a constant level.

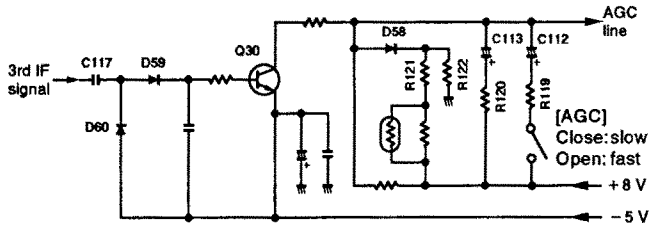
The receiver gain is determined by the voltage on the AGC line (Q30, collector). The voltage is usually set by the resistance ratio of R121 and R122.

The 3rd IF signal from the 3rd IF amplifier (Q29) is detected at the AGC detector (D59, D60) and is then applied to the DC amplifier (Q30). − 5 V is applied to the Q30 emitter to activate the AGC line to the minus voltage.

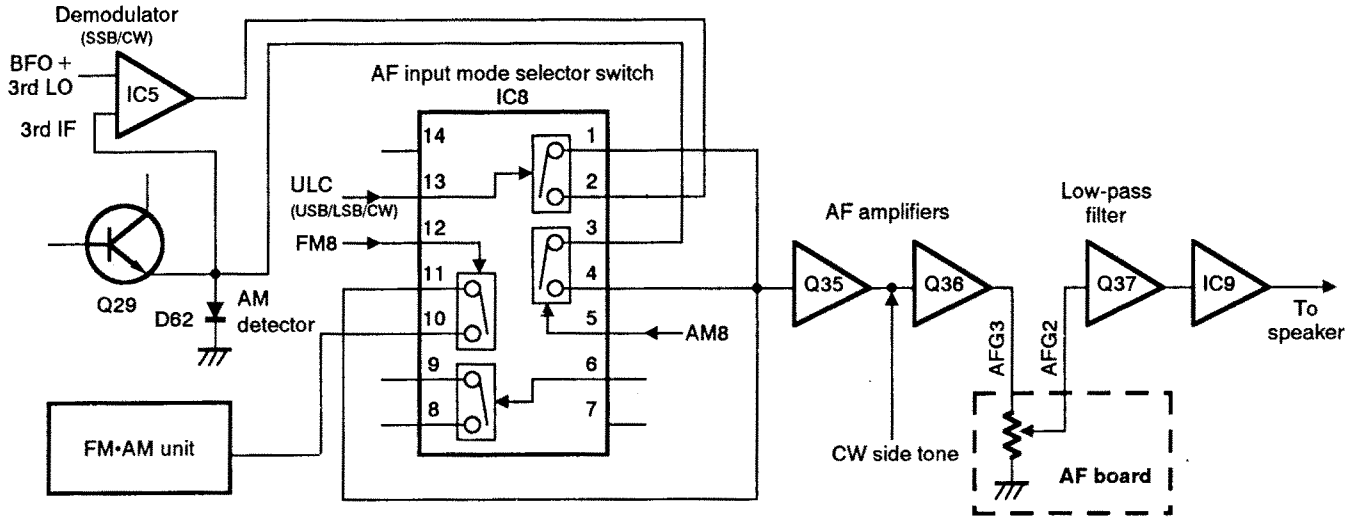
When receiving strong signals, the detected voltage increases and the voltage of the AGC line decreases via the DC amplifier (Q30). As the AGC line is used for the bias voltage of the IF amplifiers (Q15, Q21, Q27), the IF amplifiers' gain are decreases.

When the strong signal disappears, the AGC line voltage is released by C113 and R120 while fast AGC is set. When slow AGC is set, C112 and R119 are connected in parallel to obtain a slow AGC release time.

AGC CIRCUIT



AF CIRCUIT



3-1-18 S-METER CIRCUIT (MAIN UNIT)

The S-meter circuit indicates the relative received signal strength while receiving by utilizing the AGC voltage which is changed depending on the received signal strength.

The AGC bias voltage (time constant line) is applied to a differential amplifier (IC4, pin 6) where the difference between the bias and reference voltages is detected.

The resulting S-meter signal passes through the meter switching circuit (IC8) and is then applied to the meter on the front panel. The reference voltage is adjusted with R116. IC8 (pins 8 and 9) is shorted inside the IC while receiving.

The FM S-meter signal from the FM•AM unit is applied to the meter switching circuit (IC8, pin 9). The signal is also applied to the squelch circuit (IC4 pin 2).

3-1-19 SQUELCH CIRCUIT (MAIN AND FM•AM UNITS)

The squelch circuit mutes audio output when the S-meter signal is lower than the [SQUELCH] control setting level.

The S-meter signal (SSB, CW, AM) from IC4 (pin 7) is applied to the comparator (IC4, pin 2) through D56 and R110 to be compared with the threshold level set by the [SQUELCH] control.

In FM mode, the 3rd IF signal is amplified and detected at IC2 and D3/D4, respectively, in the FM•AM unit. The detected signal (S-meter signal) is then applied to the comparator (IC4, pin 2).

When the S-meter signal is lower than the threshold level, the comparator becomes "HIGH" and Q32 turns OFF to deactivate the AF input mode selector switch (IC8 pins 5, 12, 13). This cuts AF output OFF. This signal is then applied to Q34, turning OFF the [RX] indicator, and is also applied to the [MICROPHONE] connector (pin 4).

3-1-20 AF AMPLIFIER CIRCUIT (MAIN UNIT)

The AF amplifier amplifies the AF input signal to a suitable driving level for the speaker.

The AF signal from the AF input mode selector switch (IC8 pins 1, 4, 11) is applied to the AF preamplifier (Q35, Q36). The CW side tone signal is applied to Q36.

The amplified signal is applied to the [AF GAIN] control (AF board R1) and then to the 2.8 kHz cut-off active low-pass filter (Q37). The AF signal output from Q37 is power-amplified at IC9 to drive the speaker.

3-2 TRANSMITTER CIRCUITS

3-2-1 MICROPHONE AMPLIFIER CIRCUIT (SW UNIT AND VR BOARD)

The microphone amplifier circuit amplifies the microphone input signals and outputs the amplified signal to the balanced modulator and the FM•AM unit. The speech compressor circuit is included in this circuit.

Audio signals from the [MICROPHONE] connector are amplified at Q7 (SW unit) and then Q2 (VR board). The amplified signals are then applied to the [MIC GAIN] control and amplified again at Q1 (VR board). External modulation input from the [ACC(1)] socket (pin 4) is also applied to Q1 via R5 (VR board). The microphone bias voltage is supplied from this circuit.

When the speech compressor is ON, the gain of Q2 increases and the diode limiter (VR board D1, D2) is activated. The compression level is set by R1 (SW unit).

3-2-2 BALANCED MODULATOR (MAIN UNIT)

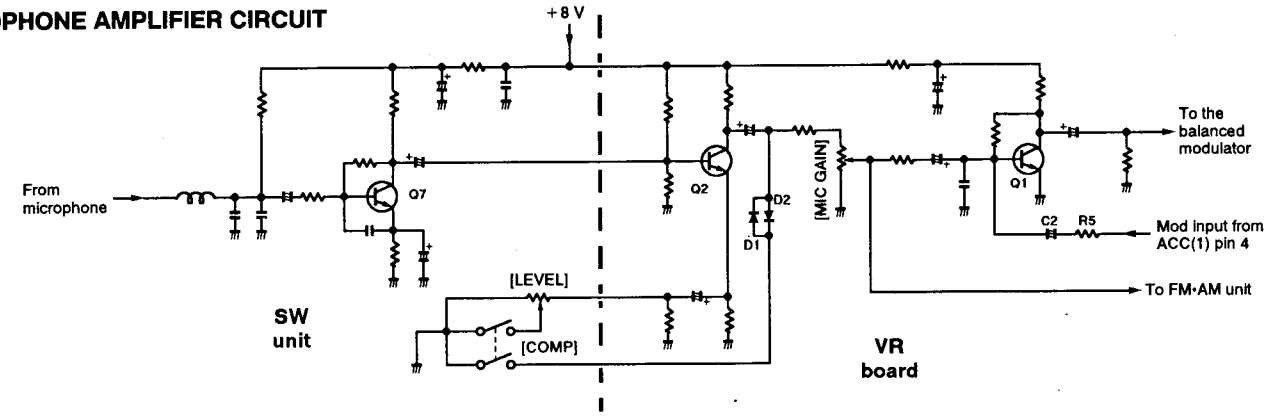
The balanced modulator converts the AF signal from the microphone amplifier to a 9 MHz IF signal with a BFO signal.

Output signals from the mic amplifier and the CW keying signal are applied to the balanced modulator (IC6). The BFO signal, buffer-amplified at Q42, is applied to IC6 (pin 7) as a carrier signal.

IC6 is a double balanced mixer IC and outputs a double side band (DSB) signal with −40 dB carrier suppression.

R177 and R179 adjust the balanced level of IC6 for maximum carrier suppression. In CW mode, the CW keying signal upsets the balance to create a carrier signal.

MICROPHONE AMPLIFIER CIRCUIT



3-2-3 FM AND AM MODULATION CIRCUITS (FM•AM UNIT)

The microphone signals from the VR unit enter the FM•AM unit via P2 (FMI2 line) and are then amplified to Q11 and the limiter amp/low-pass filter (IC5a/b).

In FM mode, the amplified signals are applied to the modulator circuit (D8). The modulation circuit changes the reactance of the FM local oscillator (Q1, X3) to obtain the FM modulation. The modulated signal is amplified at IC3 and IC4 and is then applied to the transmitter IF circuit (MAIN unit Q22).

In AM mode, the amplified signals are applied to the local oscillator amplifier (IC4) as bias voltages to obtain the AM modulation.

3-2-4 CW KEYING CIRCUIT (MAIN UNIT)

The CW keyer is connected to Q38. When the CW key is closed, 8 V is output from Q38 and this voltage controls break-in operation, the sidetone signal and the transmit signal.

The 8 V from Q38 is applied to the balanced modulator (IC6) to unbalance the IC6 input bias voltage and create a carrier signal. R241 determines the transmit delay timing.

(1) BREAK-IN

When the [BK IN] switch (S2 in the MAIN unit) is pushed IN, the IC-729 is automatically set to the transmission condition by CW keying. The 8 V from Q38 is applied to the base of Q52 via Q26. When the key is closed, Q52 grounds the SEND line for transmitting.

The transmit release delay time is determined by C252, R245 and the [DELAY] control (R244).

(2) SIDE TONE

When the CW key is closed, the side tone circuit oscillates and sends the signal to the AF circuit.

Normally, D91 is ON, and C249 is connected to the Q40 collector so that no oscillation occurs. When the CW key is closed, the 8 V from Q38 via D92 give D91 reverse bias to disconnect C249 from Q40. Q40 then oscillates with 800 Hz as a side tone signal. R268 prevents sidetone click noise.

(3) KEYING

Keying is controlled at 2 points in the IC-729. The balanced mixer (IC6) stops the carrier output by recovering the balance of the input bias voltage. D35, located at the 2nd IF mixer (IC1) input, cuts the signal line.

R240 and R241 determine the voltage wave form to IC6 (pin 5) to make the keying wave form.

3-2-5 IF AMPLIFIER (MAIN UNIT)

The SSB/CW 9 MHz IF signal passes through FI3 (FL-30) to suppress the unwanted sideband signal, then the signal is applied to a transmit IF amplifier (Q22). The optional CW narrow filter is not used in transmitting.

The amplified signal from Q22 is mixed with the 2nd LO signal and converted to a 70.45 MHz IF signal at IC1. IC1 is used in receiving and transmitting. The FM or AM signal from the FM•AM unit is also amplified at Q22 and is then applied to IC1.

The 70.45 MHz IF signal is amplified at the IF amplifier (Q7) and is then converted to the displayed frequency at the balanced mixer (Q2, Q3) with the 1st LO signal.

The gates of the IF amplifiers (Q7, Q22) are controlled by ALC bias voltage from the ALC circuit. A thermistor (R89), connected to the gate of Q22, improves the temperature characteristics of the transmitter gain. R85 adjusts the transmitter total gain.

3-2-6 RF CIRCUIT (PA, PB AND MAIN UNITS)

The displayed frequency signal converted at the balanced mixer (Q2, Q3 in MAIN unit) is applied to a bandpass filter (L2, L3, C4~C7, C415 for HF or L141, L142, C401~C405 for 50 MHz) where unwanted LO signal emission is reduced. The filtered signal is amplified at Q1, and is then applied to the PB unit via the attenuator. The signals from the MAIN unit are switched depending on HF or 50 MHz at RL1 on the PB unit.

During HF band operation, the switched signal is amplified at the predrive amplifier (Q1), drive amplifier (Q2, Q3) and power amplifier (Q5, Q6) in the PA unit to obtain a stable 100 W of RF output power.

During 50 MHz band operation, the switched signal is amplified at the predrive amplifier (Q1) and final power module (IC1) in the PB unit to obtain a stable 10 W of RF output power.

3-2-7 HF FILTER CIRCUIT (FILTER UNIT)

The HF filter circuit consists of 6 Chebyschev low-pass filters to suppress the higher harmonic components. The signal from the power amplifier (PA unit: Q5, Q6) is applied to one of the low-pass filters (depending on its frequency). The filter switching voltage from the PLL unit is applied to the FILTER unit via P2 (PLL unit: J7).

The filtered signal passes through the SWR detector circuit (L27) and is then applied to the [HF ANT] connector via RL13.

3-2-8 RF METER CIRCUIT (MAIN UNIT)

The "FOR" voltage from the FILTER or PB unit is applied to the Po meter amplifier (IC10 pin 3). The amplified voltage is output from IC10 (pin 1) and then applied to the meter. R186 adjusts the meter sensitivity and R189 and C261 are used for RF meter peak power hold.

3-2-9 ALC CIRCUIT (MAIN UNIT)

The ALC (Automatic Level Control) circuit controls the gain of IF amplifiers in order for the IC-729 to output a constant RF power set by the [RF PWR] control even when the supplied voltage shifts, etc.

The RF power signal level is detected at D1 (FILTER unit for HF) or D2 (PB unit for 50 MHz) and applied to the MAIN unit as the "FOR" voltage.

The "FOR" voltage from the FILTER or PB unit is applied to IC11 (pin 2) in the MAIN unit. The "POC" voltage, set by the [RF PWR] control (R2 on the SW unit), is applied to IC11 (pin 3) as the reference voltage.

When the "FOR" voltage exceeds the "POC" voltage, ALC bias voltage from IC11 (pin 1) controls the IF amplifiers (Q7, Q22) to adjust the output power to the determined level by the [RF PWR] control until the "FOR" and "POC" voltage levels are equalized.

In the PB unit, a high impedance resistor is used for the FOR detector circuit, therefore, the "FOR" voltage is higher than the HF detected level. Q85 and R411 on the MAIN unit compensate for the detected level when the 50 MHz band is selected.

The ALC bias voltage from IC11 (pin 1) is also applied to the inversion-amplifier (IC11 pin 6) to control the intensity of the [TX] indicator via D77 and R202, indicating the ALC level.

An external ALC input from the [ALC] jack is applied to the buffer amplifier (Q53). External ALC operation is identical to that of the internal ALC.

In AM mode, IC11 operates as an averaging ALC amplifier with C51 in the FM•AM unit. Q54 turns ON and the "POC" voltage is shifted for 40 W AM output power (maximum) through R207.

Q55 is used for power reduction to prevent excessive current flow when transmitting on the 28 MHz via the ALC line.

3-2-10 APC CIRCUIT (MAIN UNIT)

The APC (Automatic Power Control) circuit protects the power amplifiers on the PA and PB units from high SWR and excessive current.

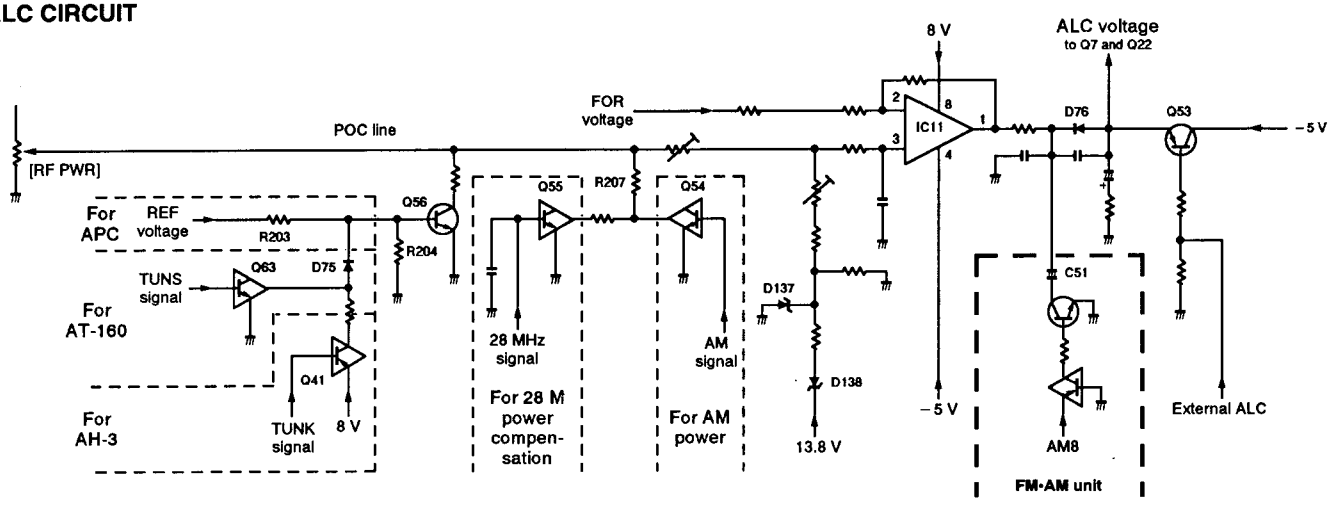
The reflected wave signal appears and increases on the antenna connector when the antenna is mismatched. D2 in the FILTER unit or D3 in the PB unit detects the signal and applies it to Q56 in the MAIN unit as the "REF" signal.

When the "REF" signal level increases, Q56 decreases the POC line voltage via R205. The POC line voltage is applied to IC11 to activate the ALC.

Since power transistors are used for the HF band's power amplifier, IC APC protects these transistors from excessive current. The power transistor current is obtained by detecting the voltage ("ICH" and "ICL") which appears at both terminals of a 0.012 Ω resistor (R26 on the PA unit). The detected voltage is applied to the differential amplifier (IC10 pins 5, 6). When the current of the final transistors is more than 22 A, the detected voltage is applied to the ALC line via D73 to prevent excessive current flow.

During tuning, with the optional AH-3 AUTOMATIC ANTENNA TUNER, the "TUNK" signal turns Q41 ON. As a result, Q56 is turned ON and the "POC" voltage is shifted for 12 W output power. When the AT-160 is selected with the tuner selection switch on the rear panel, Q63 turns ON via the "TUNS" signal, therefore, 8 V is not applied to Q56 and tuning is performed at 100 W.

ALC CIRCUIT



3-2-11 TEMPERATURE PROTECTION CIRCUIT (PA UNIT)

A cooling fan (MF1) is activated while transmitting or if the temperature of Q5 or Q6 exceeds the preset value.

A thermal switch (S1) is thermally-connected to Q6. When the Q6 temperature exceeds 90℃, S1 is turned ON and provides voltage to MF1 via R28.

Thermistor R32 detects the temperature of Q5. If the Q5 temperature is more than 50℃, when the transceiver condition has changed from transmitting to receiving, R32 rotates the cooling fan.

3-3 PLL CIRCUITS

3-3-1 GENERAL DESCRIPTION

The PLL unit generates a 1st LO signal (70.4800~100.4530 MHz for HF band and 120.4515~124.4515 MHz for 50 MHz band) and a 2nd LO signal (61.44 MHz fixed is used for the MAIN unit). The IC-729 uses a dual loop PLL system.

The main loop PLL contains 4 VCO circuits for all HF band coverage within 512 kHz steps. The sub loop PLL employs the DDS (Direct Digital Synthesizer) system which ensures a rapid lockup time and high quality frequency oscillation for 512 kHz coverage within 10 Hz steps.

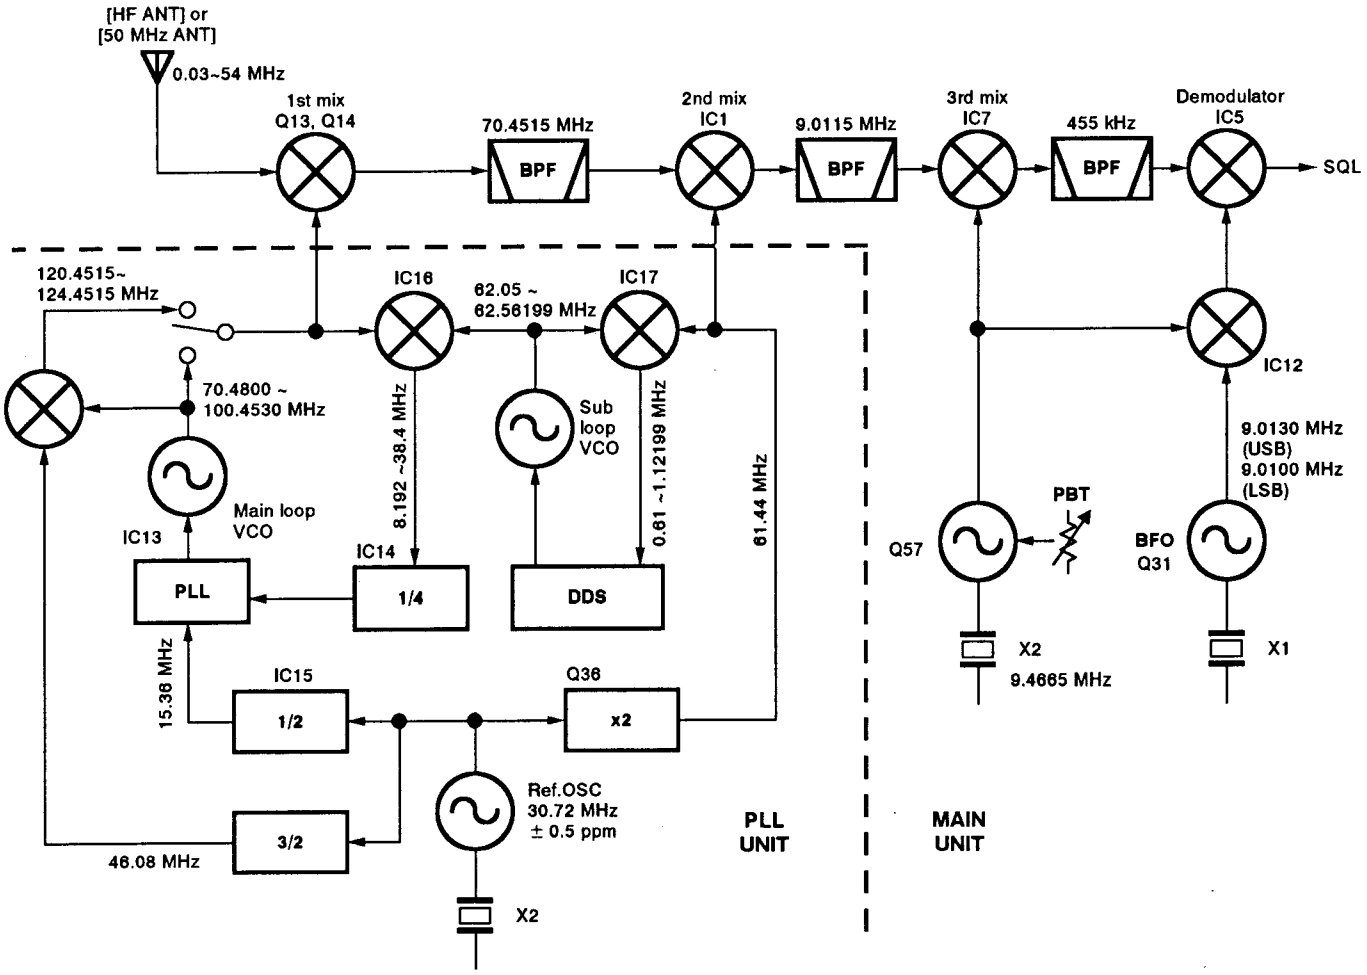
For the 50 MHz band's 1st LO signal, 46.08 MHz frequency is mixed with one of four VCO outputs to obtain 120.4515 ~ 124.4515 MHz.

3-3-2 1ST LO PLL CIRCUIT (PLL UNIT AND DDS BOARD)

The 1st LO circuit employs a dual loop PLL system. One of four VCO oscillation signals (main loop) is mixed with the signals from the sub loop PLL at IC16 and the resulting signal is divided by 4 at IC14 and then applied to the PLL IC (IC13). The signal is then divided by a programmable divider and compared with the reference frequency in IC13. The phase detected signal is converted to the lock voltage at the active loop filter (Q12~Q14) and is then fed back to a VCO circuit to control the oscillation frequency.

In the sub loop PLL, the programmable dividing and phase detection are performed by digital processing in the DDS board. The sub loop, therefore, ensures that a high speed and a high quality signal can be generated. Meanwhile, the main loop PLL generates 512 kHz steps – this means high speed PLL can be accomplished – and 10 Hz steps are processed by the DDS. The quality of the dual loop PLL circuit is determined by the sub loop PLL.

FREQUENCY CONSTRUCTION



3-3-3 MAIN LOOP CIRCUIT (PLL UNIT)

One of four VCO circuits is switched by the VCO switching signal ("VCO1"~"VCO4"). The oscillated signal is buffer-amplified at Q23 and Q46 and then applied to the mixer (IC16 pin 7). The sub loop PLL output signal is also applied to the mixer (IC16 pin 5).

The mixed signals are amplified at Q27 and then applied to the low-pass filter (L23~L25, C92, C93, C99~C103). The filtered signal is amplified at Q26 and then divided by 4 at IC14. Then the signal is applied to the PLL IC (IC13).

The signal is divided at the programmable divider section in IC13 and is then phase detected at the phase comparator section with the reference frequency. The phase detected signal is output from pin 17 and is then converted to a DC voltage (lock voltage) by the active loop filter (Q12~Q14). The lock voltage is applied to the varactor diodes (D48, D50, D52, D54) in the VCO circuits to change the capacitance of these diodes and control the oscillation frequency.

The VCO oscillating signal is then buffer-amplified at the buffer amplifiers (Q23, Q24) and is then applied to the MAIN unit as a 1st LO signal or applied to the MAIN unit after mixing with the 46.08 MHz signal for the HF band or the 50 MHz band, respectively.

3-3-4 SUB LOOP CIRCUIT (PLL UNIT AND DDS BOARD)

The oscillated signal at the sub loop VCO (Q29, 62.05~62.56199 MHz) is amplified at the buffer amplifier (Q30) and is then applied to the mixer (IC17 pin 5). The 61.44 MHz signal is also applied to this mixer (IC17 pin 7).

The mixed signal (0.61~1.12199 MHz) passes through the low-pass filter (L32, C126) and is amplified at Q32. The signal is then applied to the DDS board.

The DDS board outputs pulse-type signals. The signals are applied to the loop filter (R133, R134, C114, C115) to be converted to a DC voltage (lock voltage). The lock voltage is applied to the varactor diode (D56) to change the capacitance of this diode and control the sub loop VCO oscillation frequency.

3-3-5 REFERENCE OSCILLATOR CIRCUIT (PLL UNIT)

The reference oscillator circuit consists of Q33 and X2. 30.72 MHz reference frequency is oscillated to produce a 2nd LO signal and PLL reference frequency. The reference frequency is buffer-amplified at Q34 and is then divided by 2 at IC15 to obtain the PLL reference frequency for the PLL IC (IC13).

The 30.72 MHz reference frequency is multiplied by 2 at Q36 to obtain the 2nd LO signal. The resulting 61.44 MHz signal is filtered at the bandpass filter and is then applied to a sub loop mixer (IC17) and to the MAIN unit via P4 as the 2nd LO signal.

3-4 LOGIC CIRCUITS

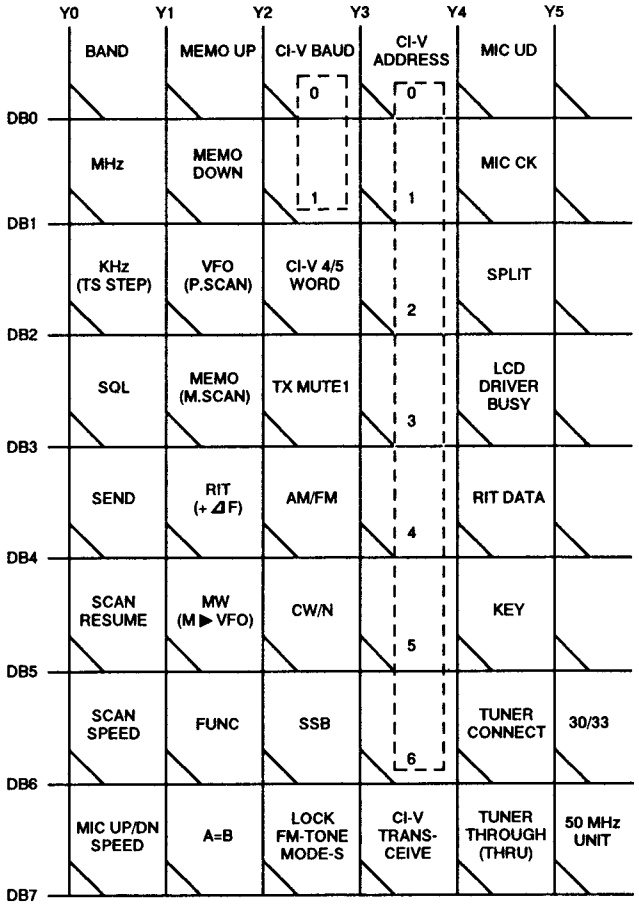
3-4-1 BAND SELECTION DATA (PLL UNIT)

To select the correct bandpass filter, the low-pass filter and VCOs on the MAIN and PLL units, the CPU outputs the following band selection data depending on the displayed frequency.

BAND SELECTION DATA

FREQUENCY (MHz)	BPF	BAND VOLTAGE	LPF	VCO
0.5~1.59999	B0	7.4 V	L1	VCO1
1.6~1.99999	B1			
2.0~3.99999	B2	6.4 V	L2	
4.0~7.99999	B3	5.4 V	L3	
8.0~10.99999	B4	0.0 V	L4	VCO2
11.0~14.99999	B5	4.4 V		
15.0~21.99999	B6	3.4 V	L5	VCO3
22.0~30.0	B7	2.4 V	L6	VCO4
50.0~54.0	BPF board	1.2 V	PB unit	VCO1

3-4-2 KEY MATRIX (PLL UNIT)



3-4-3 CPU (PLL UNIT)

The CPU (IC6) contains an 8-bit CMOS CPU, a 16k-byte ROM and a 256-byte RAM. The CPU controls the operating frequency, mode, function display, etc. The memory contents are stored in the CPU using a lithium backup battery which has a normal life of more than 5 years.

CPU PORT ALLOCATIONS

PORT NAME	PIN NUMBER	DESCRIPTION
EXTAL	3	Input port for the CPU clock.
$\overline{RES}$	6	Input port for CPU standby/operating mode switching.
$\overline{STBY}$	7	
NAR	9	Outputs a control signal for CW narrow mode.
START	10	Outputs a control signal for the connected antenna tuner.
RESET	11	Outputs a control signal for resetting a main dial counter.
P23	12	Input port for CI-V data.
P24	13	Output port for CI-V data.
ATS	14	Input port for the auto tuning step.
$\overline{Q}$, Q	15, 16	Input port for the dial up/down.
CLK, Q1~Q5	17~22	Input port for the dial counter data.
A, B, C	25~27	Outputs a band changing signal. IC19 provides each band signal.
$\overline{CS1}$	34	Outputs a control signal for reading the RIT data.
DSTB	35	Outputs a strobe signal for DDS.
PSTB	36	Outputs a strobe signal for the main loop PLL.
PCK	37	Outputs a clock signal.
$\overline{CD}$, $\overline{CS}$, $\overline{SCK}$	38~40	Outputs a command/clock signal for the display driver.

3-4-4 RIT CONTROL (PLL UNIT)

The [RIT] control shifts a voltage to shift the receive frequency. The voltage is applied to IC12 (pin 4). IC12 is an A/D converter which outputs 8-bit serial data regarding analog input voltage. The resulting serial data is applied to the CPU matrix Y4 → DB4.

3-4-5 PARALLEL/SERIAL CONVERTER (PLL UNIT)

IC11 is a parallel/serial converter IC. Parallel data from the CPU are converted into serial data to transfer the PLL N-data, DDS N-data, data for the LCD driver, etc. When the power is turned ON, the CPU also outputs programmable divider data and a control signal for universal ports to the PLL IC (IC13).

3-5 REGULATOR CIRCUITS

Either + 8 V, + 5 V or − 5 V DC is supplied from a corresponding regulator circuit. + 8 V, + 5 V and − 5 V DC are regulated at the following circuits using 13.8 V DC.

(1) + 5 V REGULATOR (PLL UNIT)

+ 5 V DC is provided by the three-terminal voltage regulator (IC10).

(2) + 8 V REGULATOR (MAIN UNIT)

+ 8 V DC is provided by the three-terminal voltage regulator (IC14).

(3) − 5 V REGULATOR (PLL UNIT)

IC6 generates a negative pulse-type voltage by converting the DC input to AC voltages (approx. 6.7 kHz) as a multi-vibrator. The voltage is rectified at D8 and D9, regulated by a zener diode (D10) and C13, and is then applied to the MAIN unit.

SECTION 4 ADJUSTMENT PROCEDURES

4-1 PREPARATION BEFORE SERVICING

■ REQUIRED TEST EQUIPMENT

EQUIPMENT	GRADE AND RANGE	EQUIPMENT	GRADE AND RANGE
DC power supply	Output voltage : 13.8 V DC Current capacity : 30 A or more	DC voltmeter	Input impedance : 50 kΩ/DC or better
RF power meter (terminated type)	Measuring range : 10~200 W Frequency range : 1.8~50 MHz Impedance : 50 Ω SWR : Less than 1.2:1	AC millivoltmeter	Measuring range : 10 mV~10 V
		External speaker	Impedance : 8 Ω
		Ammeter	Measurement capability: 1 A and 30 A
Frequency counter	Frequency range : 0.1~100 MHz Frequency accuracy : ±1 ppm or better Sensitivity : 100 mV or better	Audio generator	Frequency range : 300~3000 Hz Output level : 1~500 mV
		Attenuator	Power attenuation : 50 or 60 dB Capacity : 150 W or more
RF voltmeter	Frequency range : 0.1~100 MHz Measuring range : 0.01~10 V	Spectrum analyzer	Frequency range : At least 90 MHz Spectrum bandwidth : ±100 kHz or more
Standard signal generator (SSG)	Frequency range : 0.1~100 MHz Output level : −127~−17 dBm (0.1 μV~32 mV)	Digital multimeter or oscilloscope	Input impedance : 1 MΩ/DC or better

CW: Clockwise CCW: Counterclockwise

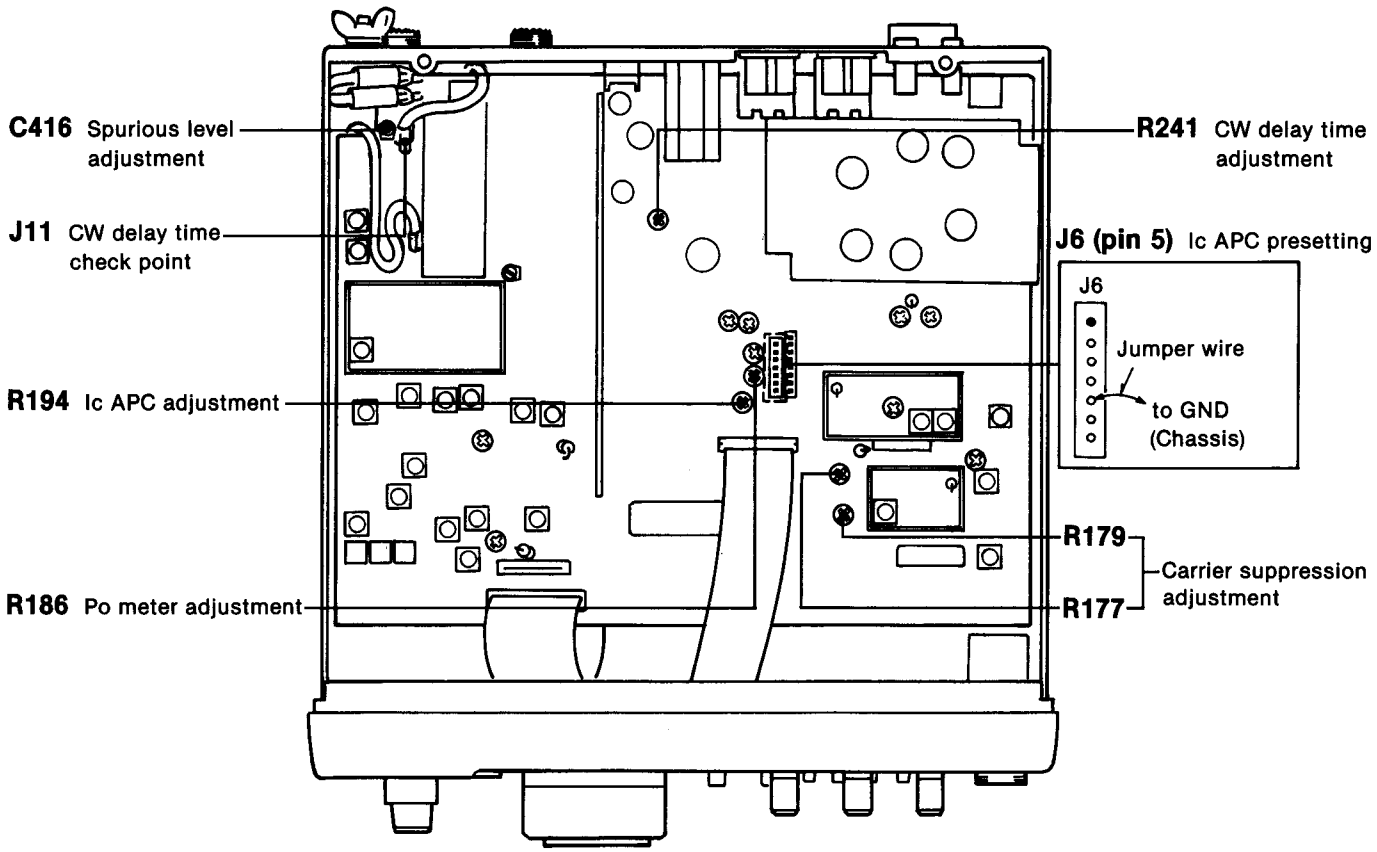
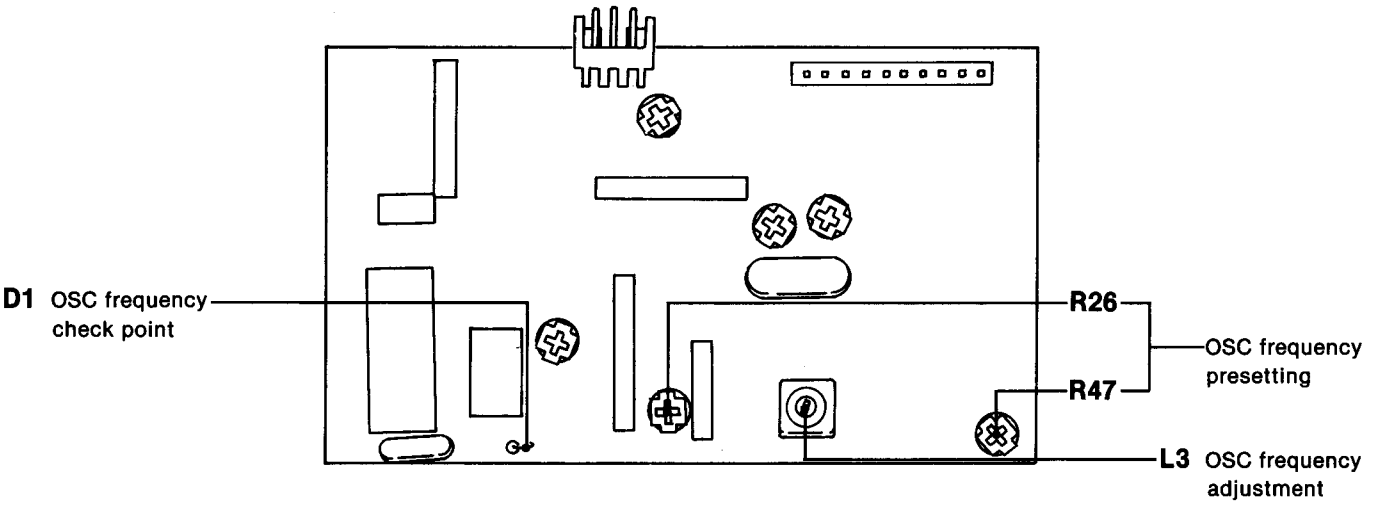
CCW • Apply no signal to the [MIC] connector. • Transmitting	Rear panel	Connect the spectrum analyzer to the [HF ANT] connector via the attenuator.	Minimum carrier level (Less than −50 dB)	MAIN	R177, R179 (Alternate adjustment)
SPURIOUS LEVEL	1	• Displayed frequency: 50.00000 MHz • Mode : CW • [RF PWR] control : Max. CW • Transmitting	Rear panel	Connect the spectrum analyzer to the [50 MHz ANT] connector via the attenuator.	Minimum spurious level	MAIN	C416
OSC FREQUENCY	1	• Displayed frequency: 29.10000 MHz • Mode : FM • R26 (FM • AM unit): Max. CW • R47 (FM • AM unit): Max. CCW • Transmitting	FM • AM	Connect the frequency counter to the cathode of D1.	9.01000 MHz	FM • AM	L3

• **MAIN UNIT**



• **FM • AM UNIT**



TRANSMITTER ADJUSTMENT (CONTINUED)

ADJUSTMENT		ADJUSTMENT CONDITIONS	MEASUREMENT		VALUE	ADJUSTMENT POINT	
			UNIT	LOCATION		UNIT	ADJUST
FM DEVIATION	1	• Displayed frequency: 29.10000 MHz • Mode : FM • [RF PWR] control : Center • Connect the audio generator to the [MIC] connector and set as: Level : 10 mV Frequency : 1 kHz • Set the FM deviation meter as: HPF : 50 Hz LPF : 20 kHz De-emphasis: OFF Detector : (P-P)/2 • Transmitting	Rear panel	Connect the FM deviation meter to the [HF ANT] connector via the attenuator.	±4.8 kHz	FM • AM	R41
	2	• Connect the audio generator to the [MIC] connector and set as: Level : 1 mV Frequency : 1 kHz			±3.5 kHz		R53
CARRIER LEVEL	1	• Displayed frequency: 29.10000 MHz • Mode : FM • R26 (FM • AM unit): Center • Transmitting	FM • AM	Connect the oscilloscope to the cathode of D1.	350 mVp-p	FM • AM	R41
AM MODULATION	1	• Displayed frequency: 29.10000 MHz • Mode : AM • R44 (FM • AM unit): Center • [MIC] control : Max. CW • Connect the audio generator to the [MIC] connector and set as: Level : 1 mV Frequency : 1 kHz • Transmitting	Rear panel	Connect the FM deviation meter to the [HF ANT] connector via the attenuator.	Maximum level	Front panel	Audio generator output frequency
	2				70 % modulation	FM • AM	R44

• FM • AM UNIT
