

## ADAPTIVE FUZZY MODELLER

**ADVANCED DATA**

- Up to 8 Input Variables and 4 Output Variables
- Up to 8 Fuzzy Sets for each Input Variables
- Up to  $2^{14}$  Fuzzy Rules
- Rules Learning Phase using an unsupervised WTA-FAM
- Membership Functions Learning Phase using a supervised BACK-FAM
- Automatic and Manual Learning Rate
- Rules Minimizer
- Gaussian and Triangular Membership Functions Shape
- Inference method based on Product or Minimum
- Step-by-Step and from File Simulation available
- Supported Target: W.A.R.P. 1.1, W.A.R.P. 2.0, MATLAB and ANSI C

**DESCRIPTION**

Adaptive Fuzzy Modeller (AFM) is a tool that easily allows to obtain a model of a system based on Fuzzy Logic data structure, starting from the sampling of a process/function expressed in terms of Input/Output values pairs (patterns).

Its primary capability is the automatic generation of a database containing the inference rules and the parameters describing the membership functions. The generated Fuzzy Logic knowledge base represents an optimized approximation of the process/function provided as input.

The AFM has the capability to translate its project files to FUZZYSTUDIO™ project files, MATLAB and C code, in order to use this environment as a support for simulation and control .

The block diagram in fig.2 illustrates the AFM logic flow.

**Figure 1. Block Diagram**

**LEARNING**

it is composed by two phases:

**BUILDING RULES** It allows to perform the automatic selection of inference rules or their manual definition, taking in to account the project constraints read from the previously opened pattern file.

As a result the user will be supplied with a rule file containing the linguistic expression of the rules. An unsupervised clustering algorithm is used to perform this task.

**BUILDING MEMBERSHIP FUNCTIONS** It allows the user to select the membership function shape and the fuzzy inference method for the project elaboration.

Starting from the rule file supplied by the previous phase, it initially associates to each fuzzy set a standard membership function shape. These shapes can be gradually tuned in order to let the fuzzy system to better approximate the process/function sampling by means of subsequently run sessions. Back-propagation algorithm with automatic learning rate control is used to this aim.

**Figure 3. BUILD MEMBERSHIP FUNCTION window**

**TOOLS**

It is composed of different sub-menus:

**LOCAL RULES** it allows to add new rules to the fuzzy logic knowledge base determined by an Adaptive Fuzzy Modeller run session. Aim of this functionality is the local approximation level improvement.

**SIMULATION** it allows to simulate the fuzzy system behaviour in order to verify the approximation level obtained during the learning phase. The simulation can be carried out in two different ways.

**Simulation Step-by-Step:** the user must supply the simulator with the values variables corresponding to the point to verify.

**Simulation from File:** the user must supply the simulator with the name of a process/function stream file that will be used to perform a complete process inference.

**Figure 2. AFM Logic Flow.**

**VIEW FEATURES**

View Features of the AFM gives with the capability to visualize the fuzzy model extracted for a particular project. It allows a separate visualization of the rules of inference and membership functions. The rules can be visualized in a linguistic format. For the membership functions you can choose between a linguistic and a graphical format visualization.

**EXPORTERS**

The Exporter provides library functions working on the databases automatically generated, which appropriately describe the data structures of the selected project in terms of a different programming environment.

These functions can be exploited inside the user's programs in order to verify the model extracted and to use it in real application.

**SUPPORTED TARGETS**

The supported environment are:

- W.A.R.P.1.1 using FUZZYSTUDIO™1.0
- W.A.R.P.2.0 using FUZZYSTUDIO™2.0
- MATLAB
- C Language
- Fu.L.L. (Fuzzy Logic Language).

**SYSTEM REQUIREMENTS**

MS-DOS version 3.1 or higher  
 Microsoft Windows 3.0 or compatible later version  
 486, PENTIUM compatible processor chip  
 8 MBytes RAM (16 Mbytes recommended)  
 Hard Disk with at least 1MBytes free space

Order Code	Description	Supported Target	Functionalities	System Requirement
STFLAFM10/SW	WTA-FAM for Building Rules BACK-FAM for Building MFs	STFLWARP11/PG STFLWARP11/PL STFLWARP20/PL ANSI C MATLAB®	Rules Minimizer Step-by-Step Simulation Simulation from File Local Tuning	MS-DOS 3.1 or higher Windows 3.0 or later 486, PENTIUM compatible 8 MB RAM

Type	Description	Operating Temperature	Package
STFLWARP11/PG-PL	HCMOS, 6KBytes RAM, 40MHz, 16 Inputs, 16 Outputs, 256 Rules	0 - 70°C	CPGA100-PLCC84
STFLWARP20/PL	HCMOS, 1.4KBytes RAM, 40MHz, 8 Inputs, 4 Outputs, 256 Rules	0 - 70°C	PLCC68

Type	Device	Development Tools	
		FUZZYSTUDIO™ ADB	FUZZYSTUDIO™ SDT
