

32 kHz Clock CMOS IC with Digital Trimming and Alarm

Features

- 32 kHz voltage regulated oscillator
- 1.1 - 2.2 V operating voltage range
- Integrated capacitors for digital trimming
- Suitable for up to 12.5 pF quartz
- Trimming inputs insensitive to stray capacitance
- Output pulse formers
- Mask options for motor period and pulse width
- Low resistance output for bipolar stepping motor
- Alarm function
- Motor-fast-test function

Pad Configuration

9611897

*) The pads for V_{DD} and OSCOUT are interchangeable per mask option

***) The pads for ALIN/-MTEST and MOT1L are interchangeable per mask-option

General Description

The e1467D is an integrated circuit in CMOS Silicon Gate Technology for analog clocks. It consists of a 32 kHz oscillator, frequency divider, output pulse formers, push-pull motor drivers and alarm output. Integrated capacitors are mask-selectable to accommodate the external quartz crystal. Additional capacitance can be selected through pad bonding, for trimming the oscillator frequency.

Absolute Maximum Ratings

Parameters	Symbol	Value	Unit
Supply voltage	V_{SS}	-0.3 to 5 V	V
Input voltage range, all inputs	V_{IN}	$(V_{SS} - 0.3 \text{ V}) \leq V_{IN} \leq (V_{DD} + 0.3 \text{ V})$	V
Output short circuit duration		indefinite	
Power dissipation (DIL package)	P_{tot}	125 mW	mW
Operating ambient temperature range	T_{amb}	-20 to +70	°C
Storage temperature range	T_{stg}	-40 to +125	°C
Lead temperature during soldering at 2 mm distance, 10 seconds	T_{sld}	260	°C

Absolute maximum ratings define parameter limits which, if exceeded, may permanently change or damage the device.

All inputs and outputs in TEMIC circuits are protected against electrostatic discharges. However, precautions to

minimize the build-up of electro-static charges during handling are recommended.

This circuit is protected against supply voltage reversal for typically 5 minutes.

Functional Description

Oscillator

An oscillator inverter with feedback resistor is provided for generation of the 32768 Hz clock frequency. Values for the fixed capacitors at OSCIN and OSCOUT are mask-selectable (see note 3 of operating characteristics). Four control inputs SC1 to SC4 enable the addition of integrated trimming capacitors to OSCIN and OSCOUT, providing 15 tuning steps.

Trimming Capacitors

A frequency variation of typ. 4 ppm for each tuning step is obtained by bonding the capacitor switch pads to V_{DD}. As none of these pads are bonded, the IC is in an untrimmed state. Figure 4 shows the trimming curve characteristic.

Note: For applications which utilize this integrated trimming feature, TEMIC will determine optimum values for the integrated capacitors C_{OSCIN} and C_{OSCOUT}.

Motor Drive Output

The e1467D contains two push-pull output buffers for driving bipolar stepping motors. During a motor pulse, the n-channel device of one buffer and the p-channel device of the other buffer will be activated. Both n-channel transistors are on and conducting, between output pulses. The outputs are protected against inductive voltage spikes with diodes to both supply pins. The motor output period and pulse width are mask programmable, as listed below:

- Available motor periods (T_M):
125, 250, 500 ms and 2, 16 s
- Available max. pulse widths (t_M):
15, 6, 23.4, 31.25, 46.9 ms
- Available motor periods for motor test (T_{MT}):
250, 500 ms and 1 s

Note: The following constraints for combination of motor period and pulse widths have to be considered: T_M > 4 * t_M, T_{MT} > 4 * t_M or alternatively T_M = 2 * t_M, T_{MT} = 2 * t_M

Alarm Outputs

The alarm output driver consists of push-pull stage for driving a speaker via an external bipolar transistor.

The output is configured for npn and pnp bipolar capability. The output is an alarm tone modulated by a low frequency. Tone frequencies, modulation frequencies, and on/off times are selectable via the metal mask option.

Alarm Input

A debounced alarm input is provided. Alarm activation is either to V_{DD} or V_{SS} by a mask option.

Test Functions

For test purposes the ALIN/MTEST pad is open. With a high resistance probe (R ≥ 10 MΩ, C ≤ 20 pF), a test frequency f_{TEST} of 128 Hz can be measured at the ALIN/MTEST pad. Connecting ALIN/MTEST (for at least 32 ms) to the opposite polarity for alarm activation changes the motor period from the selected value to T_{MT} (mask-selectable) while the pulse width remains unaffected. This feature can be used for testing the mechanical parts of the clock.

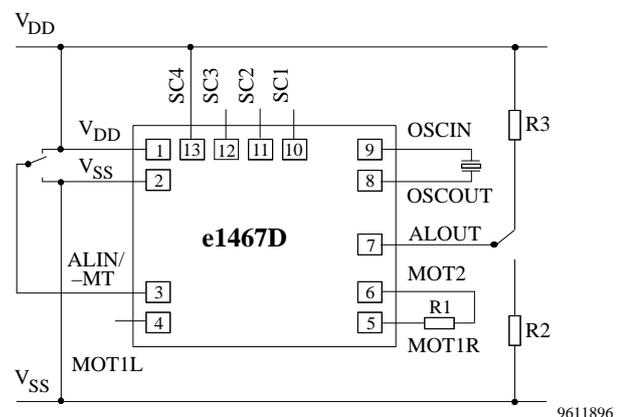

Figure 1. Functional test

Test Crystal Specification

Oscillation frequency	f _{OSC} = 32768 Hz
Series resistance	R _S = 30 kΩ
Static capacitance	C _O = 1.5 pF
Dynamic capacitance	C ₁ = 3.0 fF
Load capacitance	C _L optionally 10 or 12.5 pF

Operating Characteristics

$V_{SS} = 0$, $V_{DD} = 1.5$ V, $T_{amb} = +25^{\circ}\text{C}$, unless otherwise specified

All voltage levels are measured with reference to V_{SS} . Test crystal as specified below.

Parameters	Test Conditions / Pins	Symbol	Min.	Typ.	Max.	Unit
Operating voltage		V_{DD}	1.1	1.5	2.2	V
Operating temperature		T_{amb}	-20		+70	$^{\circ}\text{C}$
Operating current	$R_1 = \infty$, note 2	I_{DD}		1	3	μA
Motor drive output						
Motor output current	$V_{DD} = 1.2$ V, $R_1 = 200$ Ω	I_M	± 4.3			mA
Motor period		T_M		Mask option		
Motor period during motor test		T_{MT}		Mask option		
Motor pulse width		t_M		Mask option		
Oscillator						
Startup voltage	Within 2 s	V_{START}	1.2		2.2	V
Frequency stability	$\Delta V_{DD} = 100$ mV $V_{DD} = 1.1$ to 2.2 V	$\Delta f/f$		0.1	0.2	ppm
Integrated input capacitance	Note 3	C_{OSCIN}		Mask option		
Integrated output capacitance		C_{OSCOU}		Mask option		
Input current SC1 to SC4	$V_{IN} = 0.2$ V $V_{IN} = V_{DD}$, note 5	I_{SCINL} I_{SCINH}	1 0.05	5 0.15	25 0.5	μA μA
Alarm/output						
Output current for driving npn-transistor	$V_{DD} = 1.2$ V					
n-channel	$R_3 = 100$ k Ω	I_{ANn}	1	3	10	μA
p-channel	$R_2 = 1$ k Ω , note 2, note 4	I_{ANp}	-0.5	-1		mA
Output current for driving pnp-transistor	$V_{DD} = 1.2$ V					
n-channel	$R_3 = 1$ k Ω	I_{APn}	0.5	1		mA
p-channel	$R_2 = 100$ k Ω , note 2, note 4	I_{APp}	-1	-2	-10	μA
Alarm options						
Tone frequency		f_A		Mask option		Hz
Modulation frequency		f_{MOD}		Mask option		Hz
On/Off time		t_{ON}/t_{OFF}		Mask option		s
Alarm input/motor test						
Input current	$ALIN = V_{DD}$, peak current	I_{AINH}	0.6	3	10	μA
Input current	$ALIN = V_{SS}$, peak current	I_{AINL}	-0.6	-3	-10	μA
Input debounce delay		t_{AIN}	23.4		31.2	ms

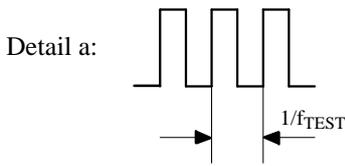

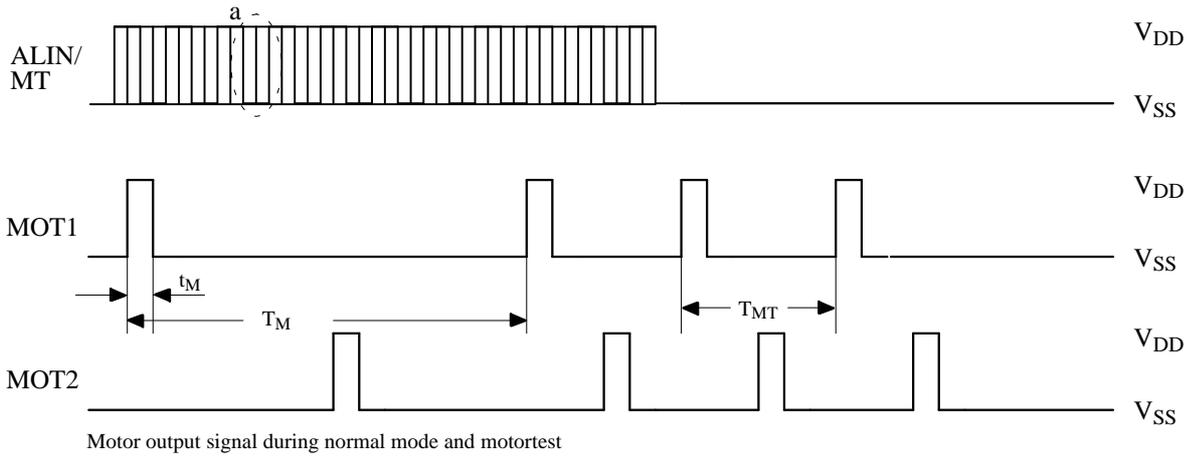

Note 1: Typical parameters represent the statistical mean values

Note 2: See test circuit

Note 3: Values can be selected in 1 pF steps. A total capacitance ($C_{OSCIN} + C_{OSCOU}$) of 38 pF is available

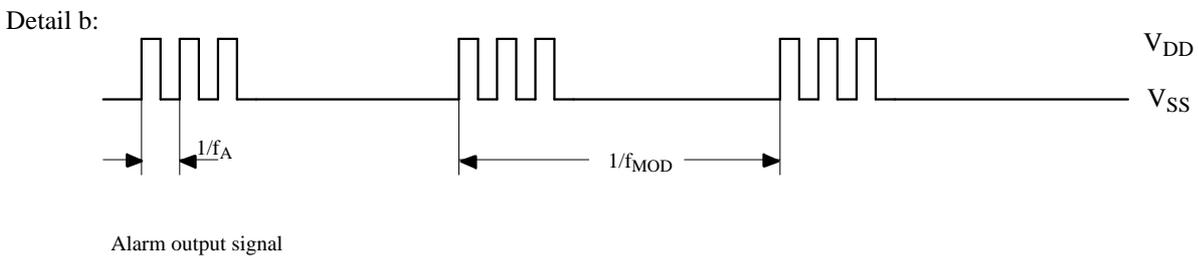

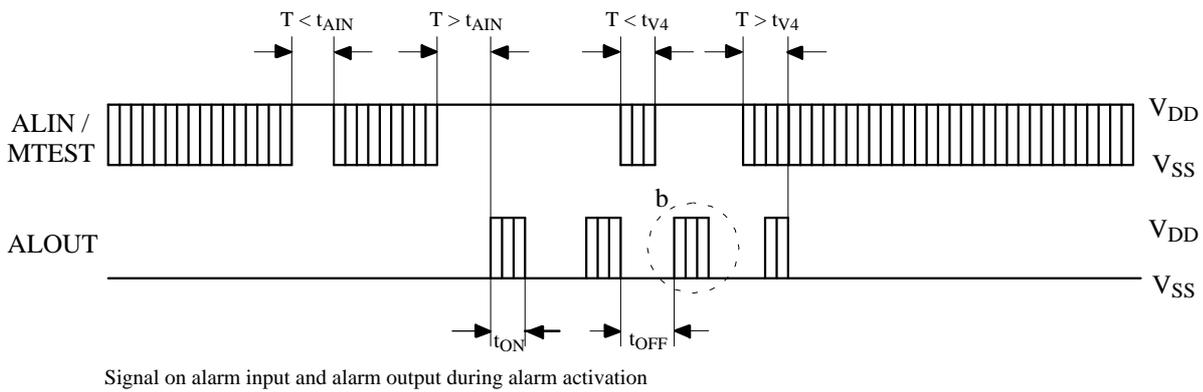

Note 4: npn or pnp driving transistors defined by mask options

Note 5: I_{SCINH} is the peak current of a pulsed current with duty cycle 1:63. Average current is always smaller than 10 nA

Figure 3. Alarm operation

9611900

Figure 4. Typical trimming curve characteristic for T_M of 2 s

C_{OX} means frequency deviation due to production process variations.

Trimming inputs SC1 ... SC4 are binary weighted, i.e., SC1 ... SC4 = 0 corresponds to trimming step 0
 SC1 ... SC4 = 1 corresponds to trimming step 15

LSB = SC1
