

**POWER COMBO DRIVER**

**DESCRIPTION**

The F-VHS Motor Driver COMBO IC includes a double three phase brushless motor driver plus a DC full bridge motor driver for VCR application.

The package is SDIP42 (38+2+2 pin ground frame).

The device is realized in BCD technology with power LDMOS output stages.

The gate drive for high side stages is provided by an internal charge pump with two external capacitors. The first three phase motor driver is devoted to the DRUM motor control.

The phase sequence update signal is provided initially by an external start-up signal (FSTART), whose frequency is internally divided by four, while, during normal operation, is provided by an optical tachometer signal.

This signal is used as clock and reset for the state machine.

The regulation of the speed is externally provided by means of PWM signal generated by the  $\mu$ P (DPWM), without external sensing resistor. The feedback to the  $\mu$ P unit is given by a suitable open drain output signal (PUD) synchronized by the internal state machine.

The second three phase motor driver is devoted to the CAPSTAN control. While the DRUM will always spin in a fixed direction, the CAPSTAN motor needs a more sophisticated logic to control the changes in spin direction.

The motor position detection is carried out by means of three comparators for Hall effect sensors. The loop regulation for this motor is still provided by the  $\mu$ P with the signals CPWM and CDIR.

The LOADING motor section include a full bridge DC motor driver. The motor operations are directly set by the inputs LPWM, LDIR according to the truth table reported on the page 5.

The device also includes a circuit for early thermal alarm, last thermal alarm and thermal shutdown with hysteresis. The output of this stage is an open drain, kept ON during normal operations.

The THERM signal follows the inverted FSTART signal between early warning and last warning temperature, while remains in high impedance (OFF) after lastwarning temperature and during thermal shutdown.

The STANDBY state of the device is imposed by

- THERMAL SHUTDOWN
- UNDERVOLTAGE ON VCC SUPPLY
- EXTERNAL SIGNAL FSTART;

This state is imposed automatically after a defined time-out.

The time-out is realized by sensing the falling edges of the FSTART signal: if no edges are recorded for a time interval greater than a certain time constant, the STANDBY condition is generated.

The time constant is defined by the external capacitor CTO.

In the STANDBY state the main functions (upper power stages, opto decoder, etc) of the device are turned off in order to minimize the power consumption.

The device also implement a HEATER function. The HEATER transistor is OFF during thermal shutdown, undervoltage condition and during normal working mode.

The HEATER transistor is driven ON when the external STANDBY condition is present according to the following table:

FSTART	HIGH	LOW
HEATER	OFF	ON

During the ON condition, the specified heater Ron is not guaranteed if all the voltage supplies are not at their minimum nominal value.

## PIN DESCRIPTION

<b>VOLTAGE SUPPLIES</b> (The power supply voltage V <sub>DD</sub> , V <sub>DC</sub> , V <sub>DL</sub> must be connected together externally)	
V <sub>DD</sub>	Power supply voltage for drum motor
V <sub>DC</sub>	Power supply voltage for capstan motor
V <sub>DL</sub>	Power supply voltage for loading motor and charge pump
V <sub>CC</sub>	Logic voltage supply
L <sub>GND</sub>	Logic Ground
G <sub>ND R</sub>	Capstan + drum power ground
G <sub>ND L</sub>	Loading + Charge pump Power ground
V <sub>S</sub>	Analog voltage supply
S <sub>GND</sub>	Analog ground
Note: The V <sub>CC</sub> and V <sub>S</sub> Power Supply must be together either at maximum or minimum value.	
<b>DRUM MOTOR</b>	
D <sub>OUT U</sub>	Winding Output U
D <sub>OUT V</sub>	Winding Output V
D <sub>OUT W</sub>	Winding Output W
D <sub>PWM</sub>	PWM logic pulse input. Control signal generated by $\mu$ P for dump motor current regulation.
P <sub>UD</sub>	Logic output position feedback generated by the translator logic
OD	Optocoupler diode output
OC	External capacitor for tacho-converter integrator
OT	Input for optocoupler transistor
OR	Tacho-converter external resistor. This resistor defines the full-light current level of the tacho.
<b>CAPSTAN MOTOR</b>	
C <sub>OUT U</sub>	Winding Output U
C <sub>OUT V</sub>	Winding Output V
C <sub>OUT W</sub>	Winding Output W
C <sub>PWM</sub>	PWM logic pulse input. Control signal generated by $\mu$ P for current regulation.
C <sub>DIR</sub>	Motor Direction Logic Input Signal
H1+	Hall sensor differential input

<b>LOADING MOTOR</b>	
L <sub>OUT A</sub>	Winding Output A
L <sub>OUT B</sub>	Winding Output B
L <sub>PWM</sub>	PWM logic input.
L <sub>DIR</sub>	Direction logic input
<b>SERVICES</b>	
HEATER	Open drain output for heater resistor
V <sub>CP</sub>	Charge pump storage capacitor pin
CP1	Bootstrap Capacitor pin
CP2	Bootstrap Capacitor pin
THERM	Open drain thermal alarm output
F <sub>START</sub>	Start-up logic signal for drum motor
CTO	Time out capacitor output

**ELECTRICAL CHARACTERISTICS** ( $T_j = 0$  to  $125^\circ\text{C}$ ;  $V_{CC} = V_S = 5\text{V} \pm 5\%$ ;  $V_{DC} = V_{DL} = V_{DD} = 10$  to  $18\text{V}$ ; unless otherwise specified.)

### POWER SUPPLY

#### # WARNING

The functionality of the I.C. is guaranteed in this voltage range. Nevertheless the specified operating voltages ( $V_{DC}$ ,  $V_{DD}$ ,  $V_{DL}$ ), must be selected according to the load characteristics. Proper cautions must be taken in the application in order to assure that the drain-source voltage across each output power transistor does not exceed 20V max.
