

LA4820M

Monaural Speaker/Stereo Headphone Power Amplifier

Overview

The LA4820M compound power IC is designed for portable information processing equipment, such as electronic book players and personal notebook computers, and provides on chip headphone stereo amplifier and monaural speaker amplifier functions required of such devices. This system IC also provides on chip a power-saving headphone jack plug-in/out detection function, which automatically switches the amplifiers, and an optimum volume level controller.

Features

- Power-saving headphone jack plug-in/out detection function on chip that electronically switches between the stereo headphone amplifier and the monaural BTL amplifier according to jack plug-in/out.
- The monaural amplifier has, as output control functions, a built-in output limiter that permits adjustment in accordance with the speaker impedance and a non-clipping circuit that outputs a sine wave suited to the output D range, while the headphone amplifier has a built-in user-friendly PVSS (Peak Volume Select System).
- On-chip ripple filter with a high ripple rejection ratio in order to reduce power line noise.
- Less external components needed thanks to system and circuit technology, and low-capacitance design (22 μF or less) allowing support for chip components.

Functions

- Monaural BTL power amplifier
- Headphone OCL power amplifier (16 Ω) \times 2
- Output control functions:
 - Headphone power PVSS
 - Monaural power Non-clipping circuit and output limiter
- Headphone jack plug-in/out detection function (monaural amplifier/headphone amplifier switching)
- Ripple filter
- Power mute switch
- Common amplifier on/off switching

Package Dimensions

unit : mm

Description of External Components

(Refer to Sample Application Circuit No. 1 for device numbers.)

- R1 (∞ to 40 k Ω): Resistor for ripple filter reference bias. Not needed when no ripple filter is used.

Resistance	$V_{CC1} - V_{CC2}$
None	1.17 V
150 k Ω	0.73 V
75 k Ω	0.52 V
40 k Ω	0.35 V

The V_{CE} voltage ($V_{CC1} - V_{CC2}$) of the Tr can be adjusted by changing the resistance value.

- R2 (270 k Ω to 100 k Ω): Resistor for smoothing (shock noise prevention) when power mute is turned on.
- R3, R4 (30 k Ω to 10 k Ω): Volume.
- R5 (5.1 M Ω to 510 k Ω): Resistor for PVSS, output limiter, and non-clipping circuit recovery.
- R6 (510 k Ω to 0 Ω): PVSS output level variable resistor. Not needed when using no PVSS.

Resistance	PVSS V_O
None	-36 dBm
100 k Ω	-25 dBm
300 k Ω	-18 dBm

- R7 (1 M Ω): Pull-down (discharging) resistor for SP/H·P switching.
- R8 (270 k Ω): Pull-up (charging) resistor for SP/H·P switching.
- R9, R10 (510 k Ω to 10 k Ω): H·P output mixing resistors for PVSS. Not needed when using no PVSS.
- R11 (2.2 Ω): Resistor for blocking common amplifier oscillation. Not needed when the common amplifier is turned off.
- R12 (510 k Ω to 0 Ω): Output limiter level variable resistor. Not needed when no output limiter is used.

Resistance	P_O
400 k Ω	400 mW
300 k Ω	290 mW
220 k Ω	200 mW
100 k Ω	110 mW
0	43 mW

The limiter level can be adjusted by changing the resistance value.

- Q1: Ripple filter output Tr (2SB1295 h_{FE6} recommended). Not needed when using no ripple filter.
- C1 (4.7 μ F to 1.0 μ F): LPF capacitor for the ripple filter reference bias. Low-region ripple rejection ratio can be varied by changing the capacitance. Not needed when using no ripple filter.

Capacitance	100 Hz SVRR	1 kHz SVRR
4.7 μ F	40 dB	60 dB
2.2 μ F	34 dB	54 dB
1.0 μ F	28 dB	48 dB

- C2 (0.1 μ F to 0.01 μ F): Capacitor for smoothing (shock noise prevention) when power mute is turned off.
- C3 (3.3 μ F to 0.22 μ F): Coupling capacitor for the MIX amplifier output and the BTL amplifier input.
- C4 (100 μ F to 0.1 μ F): Decoupling capacitor for virtual grounding and high-region noise cleaning.
- C5 (4.7 μ F to 1.0 μ F): LPF pin for V_{REF} amplifier reference bias. Ripple rejection ratio can be varied by changing the capacitance.
- C6 (22 μ F to 3.3 μ F): LPF capacitor for internal ripple filter reference bias. Ripple rejection ratio can be varied by changing the capacitance.
- C7 (33 μ F to 10 μ F): ALC rectifying capacitor for PVSS, output limiter and non-clipping circuit.

LA4820M

- C8 (0.33 μF to 0.1 μF): Coupling capacitor for PVSS detection input and H·P power output. Not needed when PVSS is not used.
- C9 (0.1 μF to 0.01 μF): Capacitor for SP/H·P switching smoothing (charging/discharging).
- C10 (0.47 μF to 2.2 μF): Capacitor for blocking common amplifier oscillation. Polyester film or ceramic capacitor (of which capacitance specified must be independent of temperature changes) is recommended. Not needed when common amplifier is turned off.
- C11 (22 μF to 47 μF): Ripple filter output capacitor. Also functions as oscillation blocking capacitor.
- C12 (220 μF to 10 μF): Power supply capacitor.
* Use of a Tantalum capacitor is recommended for C11 and C12, because electrolytic capacitors cause the high-region impedance to increase at low temperatures.

Description of Each System

1. Ripple filter

- Used when the ripple level on the power line is high and a high ripple rejection ratio is needed in the amplifier block. When not needed, pins 1, 23 and 24 must be left open. (Refer to Sample Application Circuit 2.)
- When using a ripple filter, the output Tr V_{CE} voltage and the pin 1 C1 capacitance (LPF capacitor for the reference bias) must be adjusted according to the power supply ripple level.

Power supply  The V_{CE} voltage must be adjusted to be ripple bottom peak voltage +0.1 V or more.

2. MONO amplifier block

- Adds the channel 1 and channel 2 inputs and outputs the addition in single-channel BTL operation.
 - Non-clipping and output limiter circuits are built in as output control functions.
- 1) The output limiter detects the output level from the pin 20 detection input and controls the output level by means of ALC configuration. Adjust the level according to the speaker impedance, the power dissipation capability of the power supply, etc. If not needed, the pin 20 detection input must be left open.
 - 2) The non-clipping circuit prevents large input-caused output clipping (degradation in sound quality). The detection input is connected internally, while the output level depends on the V_{CC2} voltage and is controlled by means of ALC configuration.

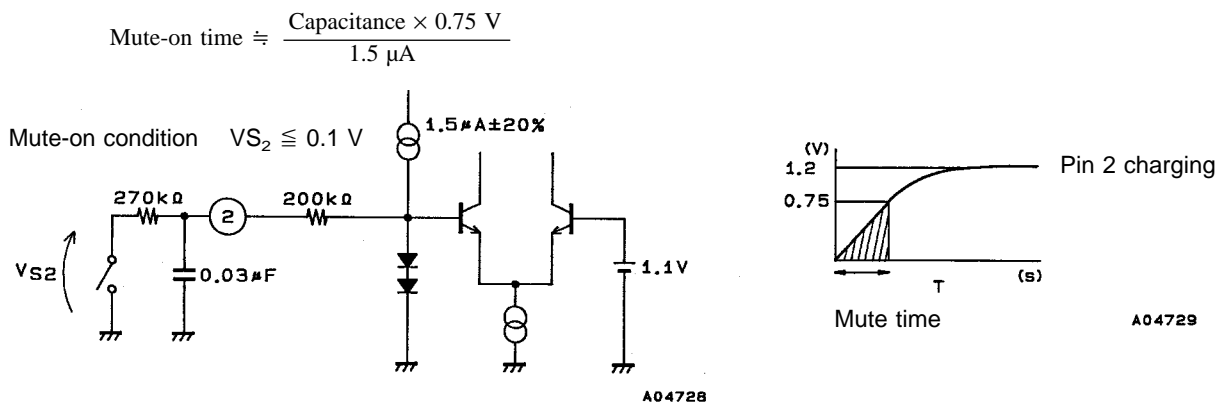

3. H·P amplifier block

- Pin 11 (PWRC CONT) can be used to create a common amplifierless configuration. (This configuration is recommended when there is a possibility that the jack common pin may be shorted with GND in an application set.)
- The output control function PVSS (Peak Volume Select System) controls the output level by means of ALC configuration (keeping user-friendly volume level, etc.); the level can be varied by an external resistor.

Descriptonal of Each Block Switching

1. Power mute switch

- When an application set is microcomputer controlled, the power supply must be turned on/off with mute turned on in order to prevent shock noise. Even if an application set is not microcomputer controlled, the mute-on time for power-on can be set by the capacitance of the external capacitor on pin 2.

LA4820M

- An equivalent circuit for the mute circuit is shown on the previous page. If the power supply is turned on, the external capacitor is charged by the internal constant current; once the voltage reaches 0.75 V (the switching level), mute turns off and the pin 2 DC voltage stabilizes at approximately 1.2 V. To turn mute on, short through a resistor to pull down pin 2. In this way, smoothing is applied by using an external capacitor and resistor to prevent switching noise when mute is turned on/off.
- The mute-on/off time during normal operation is as shown below.

2. Common amplifier control switch

- When the headphone output is connected to other equipment, in an application set in which the common amplifier output (jack common pin) may be connected to GND causing overcurrent to flow from the common amplifier, it is necessary to turn off the common amplifier. In such an application, it is recommended to use the common capacitor scheme shown in Sample Application Circuit 2 where pin 11 is grounded to turn off the common amplifier.
- An equivalent circuit for the switching circuit is shown below.
- PWRC-off condition $V_{S11} \leq 0.4$ V

3. H·P/SP switch

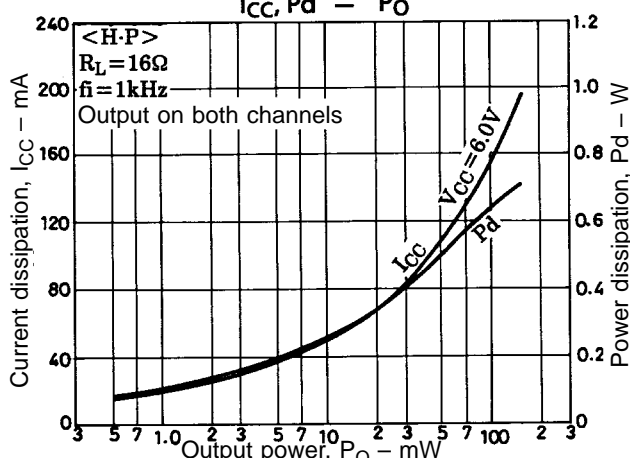

- This circuit uses a headphone jack with a switch to detect the headphone plug-in/out and automatically switch between the H·P amplifier and the MONO amplifier. When the H·P amplifier is operating, the MONO amplifier is turned off, and when the MONO amplifier is operating, the H·P amplifier is turned off.
- Smoothing is applied by using an external capacitor and resistor in order to prevent switching shock noise.
- Open H·P condition

$$V_{S14} \leq 0.2 \text{ V}$$
