# Record/Playback Amplifiers for VHS Format VCRs

### Overview

The LA70001 and LA70001M ICs provide record and playback amplifiers for VHS format VCRs. A system with an adjustment-free Y/C record current can be achieved by combining the LA70001/M with an LA71000M or LA71500M video signal processing IC.

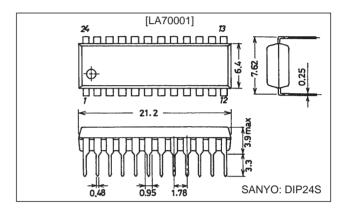

### **Features**

- Direct connection of the head to the playback amplifier input allows the number of external devices to be reduced
- A fixed-current drive technique that is strongly resistant to load fluctuations is adopted in the record amplifier for stable recording characteristics. The record amplifier includes a built-in AGC circuit.
- These products have the same package dimensions as the LA70011 and LA70011M to allow a common PCB to be used. These products can also share the same PCB with the LA70020 by mounting the IC at the right end of the LA70020 socket.

Notes:Use a resistor with an accuracy of 1.0% for the resistor between pins 13 and 14.

\*1. This is the voltage application point

\*2. Here, fix the AGC amplifier gain by applying a 1.8-V DC level to the AGC detector filter pin (pin 15).

\*3. Here, adjust the output level by applying a DC voltage to the REC-CUR-Adj pin (pin 12).

### **Usage Notes**

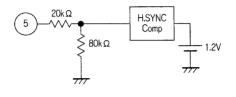

Control Pin Logic

• HA-SW (EP/SP mode switching): pin 3

GND < the pin 3 DC level < 1.5 V: SP mode 1.5 V < the pin 3 DC level < 5 V: EP mode

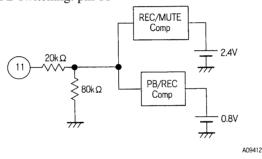

• H.SYNC input: pin 5

The pin 5 DC level > 1.5 V: The horizontal synchronization period

In record mode: Used as the REC-AGC-AMP synchronization block gate pulse.

• REC/REC-MUTE/PB switching: pin 11

GND < the pin 11 DC level < 1.0 V: Playback mode

1.0 V < the pin 11 DC level < 3.0 V: Record mode with recording muted

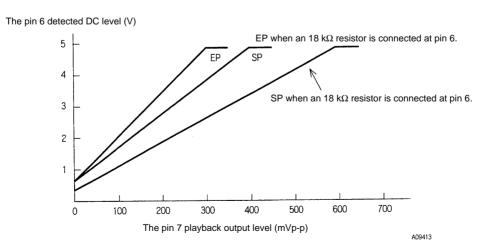

3.0 V < the pin 11 DC level < 5.0 V: Record mode

Envelope detection characteristics: pin 6

The LA70001 provides a built-in playback signal envelope detection circuit so that the tracking adjustment can be made automatic.

### Record Amplifier Gain Control

The LA70001 achieves an adjustment-free record current by adding an AGC circuit in the record amplifier block. The record current can be modified using the following method.

• Record current adjustment 2: When left open.

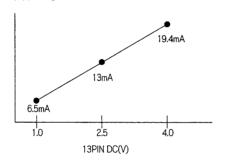

Pin 12 DC level is set to  $1/2~V_{CC}$  (approximately 2.5 V) by an internal bias, and the record current is determined by Ro1.

Design value: When Ro1 is 1.5 k $\Omega$ , the record current will be 12.7 mA per channel.

• Record current adjustment 2: When used.

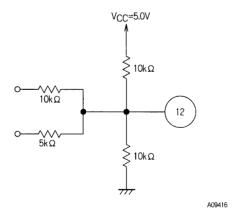

The gain can be varied by -6.0 dB to +3.5 dB relative to the value set by Ro1 by applying a control DC voltage of between 1 and 4 V to pin 12.

#### Record current (mAp-p) design value

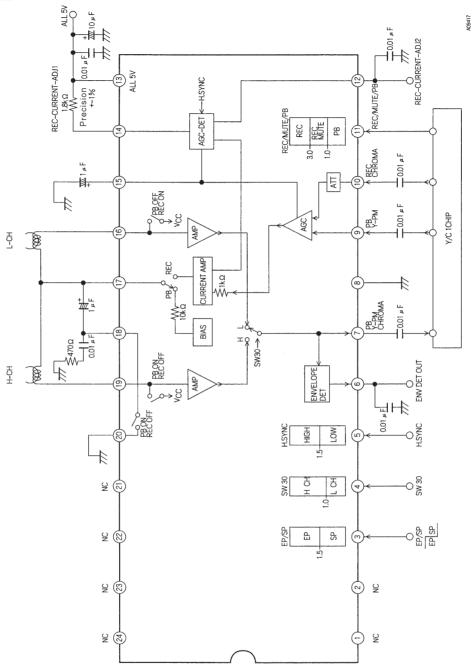

A09415

Note: The technique shown in the figure below can be used to apply a DC level to pin 12. This allows a control voltage of between 1 and 4 V to be applied.
