

LV1110NM

Digital Surround Processor IC

Overview

The LV1110NM is a digital surround processor IC developed for miniature stereo components and radio-cassette combinations. The major features built into this Bi-CMOS single-chip solution are function switching, recording volume control, surround processing, karaoke processing, 3-band graphic equalizer, and master volume control.

Features

- The built-in delay functions include input and output filters, analog-to-digital and digital-to-analog converters, delay lines with built-in memory, and delay reverberation. Other functions available are fixed matrix (L+R and L-R) and front mixing (choice of level or phase). These functions may be freely combined to easily produce a variety of surround modes and thus simulate a wide range of acoustic environments.
- The built-in karaoke functions include a vocal canceler, microphone echo, key control I/O, and other support for audio multiplexing software.

Functions

- Input function switching (Five channels with built-in 6-dB amplifier)
- Two REC output pins with volume controls (Two channels with on/off switches and choice of function output or mixer output)
- Input switching (choice of L+R, L-R, and L or R only)
- Microphone input (on/off)
- Vocal canceler
- Key control I/O pins

- Front addition (+3 dB, -3 dB, -5 dB, mute)
- I/O filters in delay block (choice of 2-, 5-, and 28-kHz low pass filters or through operation)
- Reverberation functions (with built-in volume control)
- Built-in SRAM (8 kilobytes)
- Variable delay (choice of 15, 20, 25, 30, 40, 50, 100, and 120 ms)
- Built-in V_{DD}
- I/O through or mute
- Three-band graphic equalizer (boost or cut with three steps each)
- Master volume control from 0 to -79 dB in 1-dB steps
- QIP-64E package with 0.8-mm pin pitch

Package Dimensions

unit: mm

3159-QFP64E

■ Any and all SANYO products described or contained herein do not have specifications that can handle applications that require extremely high levels of reliability, such as life-support systems, aircraft's control systems, or other applications whose failure can be reasonably expected to result in serious physical and/or material damage. Consult with your SANYO representative nearest you before using any SANYO products described or contained herein in such applications.

■ SANYO assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO products described or contained herein.

Specifications

Absolute Maximum Ratings at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Maximum power supply voltage	$V_{CC\ max}$		12	V
Maximum power dissipation	$P_{d\ max}$	$T_a \leq 70^\circ\text{C}$ 114.3 × 76.1 × 1.6 mm ³ Mounted on glass epoxy circuit board	500	mW
Operating temperature	T_{opr}		-25 to +70	°C
Storage temperature	T_{stg}		-40 to +125	°C

Operating Conditions at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Recommended power supply voltage	V_{CC}		9	V
Operating power supply voltage range	$V_{CC\ opg}$		8 to 11	V
Control data high-level voltage	V_{IH}		3.5 to 5.5	V
Control data low-level voltage	V_{IL}		0 to 1.2	V

Electrical Characteristics at $T_a = 25^\circ\text{C}$, $V_{CC} = 9\text{ V}$, $f_{IN} = 1\text{ kHz}$, $V_{IN} = 300\text{ mVrms} = 0\text{ dB}$, $R_L = 10\text{ k}\Omega$

Parameter	Symbol	Conditions	Ratings			Unit
			min	typ	max	
Quiescent current	I_{CCO}		19	28	42	mA
Input function switching (measured for function in input / function out)						
Output level deviation	VG_{F1}	IN A, D	-2	0	+2	dB
	VG_{F2}	IN B, C, E	4	6	8	dB
Maximum output voltage	V_{OF}	$V_{CC} = 8.5\text{ V}$, THD = 1%	2.0	2.4		V
Distortion	THD_F	400 to 30 kHz BPF		0.005	0.03	%
Output noise voltage	V_{NOF}	$R_g = 10\text{ k}\Omega$, JISA		-102	-95	dBV
Interchannel crosstalk	CT_F	$R_g = 10\text{ k}\Omega/V_O = 1\text{ Vrms}$, JIS A	82	100		dB
L and R channel total throughput (measured for L and R inputs and L and R outputs)						
Output level deviation	VG_T		-2	0	+2	dB
Signal handling	SH_T	$V_{CC} = 8.5\text{ V}$, THD = 1%, 300 mVrms = 0 dB	15.0	16.5		dB
Distortion	THD_T	400 to 30 kHz BPF		0.005	0.03	%
Signal-to-noise ratio	SNT	$R_g = 10\text{ k}\Omega$, CCIR-ARM, 300 mVrms = 0 dB	85	100		dB
Interchannel crosstalk	CT_T	$R_g = 10\text{ k}\Omega/V_O = 1\text{ Vrms}$, JIS A	82	94		dB
S channel (measured for delay = 20 ms, reverb. off, L-R, S-IN input, S-OUT output)						
Output level deviation	VG_S		-3	0	+3	dB
Signal handling	SH_S	THD = 3%, 300 mVrms = 0 dB, $V_{CC} = 8.5\text{ V}$	15.0	16.5		dB
Distortion	THD_S	400 to 30 kHz BPF, OUT FILTER: 5 kHz LPF		0.1	0.7	%
Signal-to-noise ratio	SN_S	$R_g = 10\text{ k}\Omega$, CCIR-ARM, 300 mVrms = 0 dB OUT FILTER: 5 kHz LPF	60	68		dB
Long delay (measured for delay = 100 ms, reverb. off, MIC-IN input, S-OUT output)						
Output level deviation	VG_D	OUT FILTER: 2 kHz LPF	-4.5	-1.5	+1.5	dB
Maximum output voltage	V_{OD}	THD = 3%, $V_{CC} = 8.5\text{ V}$	1.4	1.8		V
Distortion	THD_D	400 to 30 kHz BPF, OUT FILTER: 2 kHz LPF		2.0	3.0	%
Output noise voltage	V_{NOD}	$R_g = 10\text{ k}\Omega$, JIS A, OUT FILTER: 2 kHz LPF		-75	-66	dBV
Vocal cut	VC		-16	-20	-24	dB
[REC output (measured for volume = 0 dB, function in, A input, REC OUT)]						
Output level deviation	VG_R		-2	0	+2	dB
Maximum output voltage	V_{OR}	THD = 1%, $V_{CC} = 8.5\text{ V}$	1.6	2.0		V
Distortion	THD_R	400 to 30 kHz BPF		0.006	0.03	%
Output noise voltage	V_{NOR}	$R_g = 10\text{ k}\Omega$, JIS A		-106	-95	dBV

Notes on control data

A10964

- The device latches the individual data bits of the command at the rising edge of the clock signal.
- One frame consists of 16 bits (A to D13).
- The device latches the data for the command at the rising edge of the enable signal.
- Maintain the clock and enable signals at High level when not controlling the LV1110NM.
- Maintain the enable signal at High level for at least 10 μs between commands.

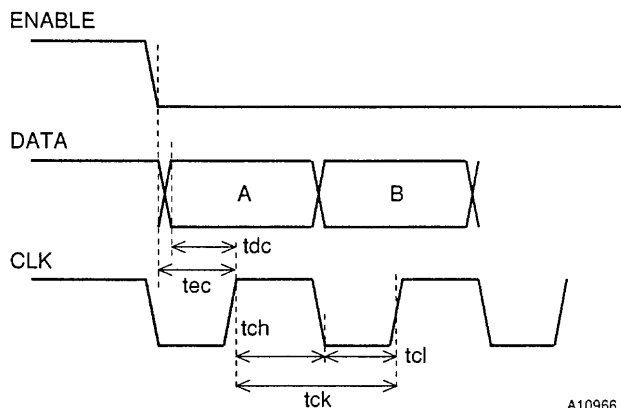

A10965

Important note on mode control and using system muting

- When the power is first applied, allow the IC sufficient time to initialize (approximately 2 seconds) and then send it commands to turn system muting off and then on.
- When changing the delay, always turn system muting on and then off—that is, send the new data with the command to turn system muting on and again with the command to turn it back off.
Both operations enhance reliability by forcing the device to initialize its memory.

Data timing

A10966

Timing Characteristic

Parameter	Symbol	Ratings			Unit
		min	typ	max	
Enable-to-clock delay	tec	5			μs
Data-to-clock delay	tdc	5			μs
Clock high-level hold time	tch	5			μs
Clock high-level hold time	tcl	5			μs
Clock period	tck	10			μs

Control Commands

A = L, B1 = L, B2 = L

- D1, D2, and D3: Function input switching. In CD and MD modes an output buffer is used, but the 6-dB amplifier output is used for tape, tuner, and EXT modes. The input impedance is 50 k Ω .
- D4, D5, and D6: Matrix mode switching and total through switching. The signal selected by the matrix is mixed to the left and right channels according to D10 and used to form the surround signal according to the D11 and D12 delay signal selection bits. In total through mode, the left and right signals are directly output with the matrix and graphic equalizer blocks bypassed to provide a high signal-to-noise ratio output.
- D7: Audio rejection on/off. When this bit is set to 1, L+R mode must be selected with D4, D5, and D6.
- D8: Microphone mixing on/off.
- D9: Key control interface on/off. The signal (BGM) set up by the matrix block is output from pin 6 and the signal processed by key control is mixed into the left and right channels by inputting it to pin 7.
- D10: Left and right channel bypass/matrix switching. When matrix is selected, monaural and karaoke multi-sound software L/R only modes can be set up.
- D11: Surround signal I/O (input: pin 32, output: pin 33) on/off.
- D12 and D13: Delay line signal input switching. When SW = B, the signal processed by key control can be input to the delay line.

A = L, B1 = H, B2 = L

- D1 and D2: Delay line output filter switching: A 5-kHz or higher low-pass filter cutoff frequency is recommended for delay times of 15 to 50 ms, and a 2-kHz low-pass filter for 100 and 120 ms delay times.
- D3, D4, and D5: Reverb volume switching. Since oscillation may occur at the 0 dB setting, always use a setting of -1 dB or lower.
- D6, D7, and D8: Delay time setting.
- D9: System muting on/off. Always use the system muting function (D9) when changing the delay time. Turning the muting function on and the off again initializes memory and prevents incorrect operation.
- D10: Left and right channel output (pins 20 and 21) muting on/off.
- D11: Front mix right channel phase switching. Selects whether the delayed signal is added into the right channel in phase or out of phase relative to the left channel.
- D12 and D13: Front mix level switching.

A = L, B1 = L, B2 = H

- D1, D2, and D3: Graphic equalizer bass boost/cut level setting.
- D4, D5, and D6: Graphic equalizer mid boost/cut level setting.
- D7, D8, and D9: Graphic equalizer treble boost/cut level setting.
- D10 and D11: Port output high/low level settings. When set to high, the corresponding port pin is pulled up to VDD through a 51-k Ω resistor, and when set to low, the pin is pulled down with an npn transistor (about 1 k Ω).

A = L, B1 = H, B2 = H, D1 = L

- D2, D3, D4, D5, D6, D7, and D8: Left channel master volume setting.
- D9, D10, and D11: Record volume setting.

A = L, B1 = H, B2 = H, D1 = H

- D2, D3, D4, D5, D6, D7, and D8: Right channel master volume setting.
- D9: Record output signal switching. Selects function output or mixer output.
- D10 and D11: Record output on/off (muting). D10 controls the pin 2 and pin 52 outputs and D11 controls the pin 3 and 53 outputs.

LV1110NM

Control Command Examples

The LV1110M provides the following functions required in digital surround systems: matrix, delay line, reverb volume, front mix (level and phase switching), and a graphic equalizer. It also provides microphone echo, a key control interface, vocal track removal, and multi-sound software support functions and associated settings as karaoke functions. The tables present examples of commands that control these functions.

MIC Mix: Echo, Lch Only, Delay 100 ms, Reverb –1 dB, Front add +3 dB: 2 kHz LPF

Graphic equalizer level attenuation technique

A11038

- Since the graphic equalizer provides a maximum boost of 10 dB, the head room is insufficient when this boost is used. Therefore, the signal level must be attenuated in the graphic equalizer block. One technique for providing this attenuation is to connect resistors in series with the external capacitors connected at pins 8 and 9 in the DC cut circuit. The formula below can be used to determine the amount of attenuation due to the value of the resistor.

Attenuation: $V_G = 20 \times \log (1 - R/10 K + R)$ dB

Example: If $R = 10 k\Omega$, the attenuation will be -6 dB.
