CMOS

F²MC-16LX MB90520 Series

MB90522/523/F523/V520

■ DESCRIPTION

The MB90520 series is a general-purpose 16-bit microcontroller developed and designed by Fujitsu for process control applications in consumer products that require high-speed real-time processing.

The instruction set of F²MC-16LX CPU core inherits AT architecture of F²MC*1 family with additional instruction sets for high-level languages, extended addressing mode, enhanced multiplication/division instructions, and enhanced bit manipulation instructions. The microcontroller has a 32-bit accumulator for processing long word data.

The MB90520 series has peripheral resources of 8/10-bit A/D converter, a 8-bit D/A converter, UART (SCI), extended I/O serial interfaces 0 and 1, 8/16-bit up/down counter/timers 0 and 1, 8/16-bit PPG timers 0 and 1, I/O timer (16-bit free-run timers 1 and 2, input captures 0 and 1 (ICU), output compares 0 and 1 (OCU)), LCD controller/driver.

*1: F²MC stands for FUJITSU Flexible Microcontroller.

■ PACKAGE

120-pin Plastic LQFP

(FPT-120P-M05)

120-pin Plastic QFP

(FPT-120P-M13)

MB90520 Series

■ FEATURES

- Clock
 - Embedded PLL clock multiplication circuit
 - Operating clock (PLL clock) can be selected from divided-by-2 of oscillation or one to four times the oscillation (at oscillation of 4 MHz, 3 MHz to 16 MHz).
 - The system can be operated by an oscillation sub-clock (rated at 32.768 kHz).
 - Minimum instruction execution time: 62.5 ns (at oscillation of 4 MHz, four times the PLL clock, operation at V_{CC} of 5.0 V)
- Maximum memory space
 - 16 Mbytes
- Instruction set optimized for controller applications
 - Ri65data types (bit, byte, word, long word)
 - Rich addressing mode (23 types)
 - Enhanced signed multiplication/division instruction and RETI instruction functions
 - Enhanced precision calculation realized by the 32-bit accumulator
- Instruction set designed for high level language (C) and multi-task operations
 - Adoption of system stack pointer
 - Enhanced pointer indirect instructions
 - Barrel shift instructions
- Program patch function (for two address pointers)
- Enhanced execution speed
 - 4-byte instruction queue
- Enhanced interrupt function
 - 8 levels, 34 factors
- Automatic data transmission function independent of CPU operation
 - Extended intelligent I/O service function (EI²OS): Up to 16 channels
- Embedded ROM size and types
 - Mask ROM: 64 kbytes/128 kbytes
 - Flash ROM: 256 kbytes
 - Embedded RAM size: 4 kbytes/10 kbytes (mass-produced products)
 - 4 kbytes (flash memory)
 - 6 kbytes (evaluation chip)
- Low-power consumption (stand-by) mode
 - Sleep mode (mode in which CPU operating clock is stopped)
 - Stop mode (mode in which oscillation is stopped)
 - CPU intermittent operation mode
 - Hardware stand-by mode
 - Clock mode (mode in which other than sub-oscillation and timebase timer are stopped)
- Process
 - CMOS technology
- I/O port
 - General-purpose I/O ports (CMOS): 53 ports
 - General-purpose I/O ports (via pull-up resistors): 24 ports
 - General-purpose I/O ports (open-drain): 8 ports
 - Total: 85 ports

(Continued)

MB90520 Series

(Continued)

- Timer
 - Timebase timer/watchdog timer: 1 channel
 - 8/16-bit PPG timers 0, 1: 8-bit × 2 channels or 16-bit × 1 channel
 - 16-bit re-load timers 0, 1: 2 channels
- 16-bit I/O timer
 - 16-bit free-run timers 1, 2: 2 channels
 - Input captures 0, 1 (ICU): Generates an interrupt request by latching a 16-bit free-run timer counter value upon detection of an edge input to the pin.
 - Output compares 0, 1 (OCU): Generates an interrupt request and reverse the output level upon detection of a match between the 16-bit free-run timer counter value and the compare setting value.
- 8/16-bit up/down counter/timers 0, 1: 1 channel (8-bit × 2 channels)
- Extended I/O serial interfaces 0, 1: 1 channel
- UART (SCI)
 - With full-duplex double buffer
 - Clock asynchronized or clock synchronized transmission can be selectively used.
- DTP/external interrupt circuit (8 channels)
 - A module for starting extended intelligent I/O service (EI²OS) and generating an external interrupt triggered by an external input.
- Wake-up interrupt
 - Receives external interrupt requests and generates an interrupt request upon an “L” level input.
- Delayed interrupt generation module
 - Generates an interrupt request for switching tasks.
- 8/10-bit A/D converter (8 channels)
 - 8/10-bit resolution can be selectively used.
 - Starting by an external trigger input.
 - Conversion time: 16.0 μs or slower
- 8-bit D/A converter (based on the R-2R system)
 - 8-bit resolution: 2 channels (independent)
 - Setup time: 12.5 μs
- Clock timer: 1 channel
- LCD controller/driver
 - A common driver and a segment driver that can directly drive the LCD (liquid crystal display) panel
- Clock output function

Note: Do not set external bus mode for the MB90520 series because it cannot be operated in this mode.

MB90520 Series

■ PRODUCT LINEUP

Part number		MB90522	MB90523	MB90F523	MB90V520
Item					
Classification		Mass-produced products (mask ROM products)		Mass-produced product (flash ROM product)	Evaluation product
ROM size		64 kbytes	128 kbytes		None
RAM size		6 kbytes			
CPU functions		The number of instructions: 340 Instruction bit length: 8 bits, 16 bits Instruction length: 1 byte to 7 bytes Data bit length: 1 bit, 8 bits, 16 bits			
		Minimum execution time: 62.5 ns (at machine clock of 16 MHz)	Minimum execution time: 100 ns (at machine clock of 10 MHz)	Minimum execution time: 62.5 ns (at machine clock of 16 MHz)	
		Interrupt processing time: 1.5 μ s (at machine clock of 16 MHz, minimum value)			
Ports		General-purpose I/O ports (CMOS output): 53 General-purpose I/O ports (via pull-up resistor): 24 General-purpose I/O ports (N-ch open-drain output): 8 Total: 85			
UART (SCI)		Clock synchronized transmission (62.5 kbps to 1 Mbps) Clock asynchronized transmission (1202 bps to 9615 bps) Transmission can be performed by bi-directional serial transmission or by master/slave connection.			
8/10-bit A/D converter		Conversion precision: 8/10-bit can be selectively used. Number of inputs: 8 One-shot conversion mode (converts selected channel only once) Scan conversion mode (converts two or more successive channels and can program up to 8 channels.) Continuous conversion mode (converts selected channel continuously) Stop conversion mode (converts selected channel and stop operation repeatedly)			
8/16-bit PPG timers 0, 1		Number of channels: 1 (8-bit \times 2 channels) PPG operation of 8-bit or 16-bit A pulse wave of given intervals and given duty ratios can be output. Pulse interval: 62.5 ns to 1 μ s (at oscillation of 4 MHz, machine clock of 16 MHz)			
8/16-bit up/down counter/ timers 0, 1		Number of channels: 1 (8-bit \times 2 channels) Event input: 6 channels 8-bit up/down counter/timer used: 2 channels 8-bit re-load/compare function supported: 1 channel			
16-bit I/O timer	16-bit free- run timers 1, 2	Number of channels: 2 Overflow interrupts

MB90520 Series

(Continued)

Part number		MB90522	MB90523	MB90F523	MB90V520
Item					
16-bit I/O timer	Output compares 0, 1 (OCU)	Number of channels: 8 Pin input factor: A match signal of compare register			
	Input captures 0, 1 (ICU)	Number of channels: 2 Rewriting a register value upon a pin input (rising, falling, or both edges)			
DTP/external interrupt circuit		Number of inputs: 8 Started by a rising edge, a falling edge, an "H" level input, or an "L" level input. External interrupt circuit or extended intelligent I/O service (EI ² OS) can be used.			
Wake-up interrupt		Number of inputs: 8 Started by an "L" level input.			
Delayed interrupt generation module		An interrupt generation module for switching tasks Used in real-time operating systems.			
Extended I/O serial interfaces 0, 1		Clock synchronized transmission (3125 bps to 1 Mbps) LSB first/MSB first			
Timebase timer		18-bit counter Interrupt interval: 1.024 ms, 4.096 ms, 16.384 ms, 131.072 ms (at oscillation of 4 MHz)			
8-bit D/A converter		8-bit resolution Number of channels: 2 channels Based on the R-2R system			
LCD controller/driver		Number of common output pins: 4 Number of segment output pins: 32 Number of power supply pins for LCD drive: 4 RAM for LCD indication: 16 bytes Booster for LCD drive: Internal Split resistor for LCD drive: Internal			
Watchdog timer		Reset generation interval: 3.58 ms, 14.33 ms, 57.23 ms, 458.75 ms (at oscillation of 4 MHz, minimum value)			
Low-power consumption (stand-by) mode		Sleep/stop/CPU intermittent operation/clock timer/hardware stand-by			
Process		CMOS			
Power supply voltage for operation*		3.0 V to 5.5 V	4.0 V to 5.5 V	3.0 V to 5.5 V	3.0 V to 5.5 V

* : Varies with conditions such as the operating frequency. (See section "■ Electrical Characteristics.")
Assurance for the MB90V520 is given only for operation with a tool at a power voltage of 3.0 V to 5.5 V, an operating temperature of 0 to 55 degrees centigrade, and an operating frequency of 1 MHz to 16 MHz.

■ DIFFERENCES AMONG PRODUCTS

Memory Size

In evaluation with an evaluation chips, note the difference between the evaluation chip and the chip actually used. The following items must be taken into consideration.

- The MB90V520 does not have an internal ROM, however, operations equivalent to chips with an internal ROM can be evaluated by using a dedicated development tool, enabling selection of ROM size by settings of the development tool.
- In the MB90V520, images from FF4000_H to FFFFFFF_H are mapped to bank 00, and FE0000_H to FF3FFF_H to mapped to bank FE and FF only. (This setting can be changed by configuring the deveolpment tool.)
- In the MB90522, images from FF4000_H to FFFFFFF_H are mapped to bank 00, and FF0000_H to FF3FFF_H to bank FF only.
- In the MB90523/F523, images from FF4000_H to FFFFFFF_H are mapped to bank 00, and FE0000_H to FF3FFF_H to bank FE and bank FF.

■ PIN ASSIGNMENT

MB90520 Series

■ PIN DESCRIPTION

Pin no.	Pin name	Circuit type	Function
LQFP-120*1 QFP-120*2			
92, 93	X0, X1	A	This is a high-speed crystal oscillator pin.
74, 73	X0A, X1A	B	This is a low-speed crystal oscillator pin.
89 to 87	MD0 to MD2	C	This is an input pin for selecting operation modes. Connect directly to V _{CC} or V _{SS} .
90	$\overline{\text{RST}}$	C	This is external reset request signal.
86	$\overline{\text{HST}}$	C	This is a hardware stand-by input pin.
95 to 101	P00 to P06	D	This is a general-purpose I/O port. This function can be set by the port 0 input pull-up resistor setup register (RDR0) for input. For output, however, this function is invalid.
	INT0 to INT6		This is a request input pin of the DTP/external interrupt circuit ch.0 to ch.6.
102	P07	D	This is a general-purpose I/O port. This function can be set by the port 0 input pull-up resistor setup register (RDR0) for input. For output, however, this function is invalid.
103 to 110	P10 to 17	D	This is a general-purpose I/O port. This function can be set by the port 1 input pull-up resistor setup register (RDR1) for input. For output, however, this function is invalid.
	WI0 to WI7		This is an I/O pin for wake-up interrupts.
111, 112, 113, 114	P20, P21, P22, P23	E	This is a general-purpose I/O port.
	IC00, IC01, IC10, IC11		This is a trigger input pin for input capture (ICU) 0 and 1. Since this input is used as required for input capture 0 and 1 (ICU) ch.0, ch.01, ch.10 and ch.11 input operation, output by other functions must be suspended except for intentional operation.
115	P24	E	This is a general-purpose I/O port.
	AIN0		This port can be used as count clock A input for 8/16-bit up/down counter/timer 0.
116	P25	E	This is a general-purpose I/O port.
	BIN0		This port can be used as count clock B input for 8/16-bit up/down counter/timer 0.

MB90520 Series

Pin no. LQFP-120*1 QFP-120*2	Pin name	Circuit type	Function
117	P26	F	This is a general-purpose I/O port.
	ZIN0		This port can be used as count clock Z input for 8/16-bit up/down counter/timer 0.
	INT7		This is a request input pin of the DTP/external interrupt circuit ch.7.
118	P27	F	This is a general-purpose I/O port.
	$\overline{\text{ADTG}}$		This is external trigger input pin of the 8/10-bit A/D converter. Since this input is used as required for 8/10-bit A/D converter input operation, output by other functions must be suspended except for intentional operation.
120	P30	E	This is a general-purpose I/O port.
1	P31	E	This is a general-purpose I/O port.
	CKOT		This is a clock monitor function output pin. This function is valid when clock monitor output is enabled.
2	P32	E	This is a general-purpose I/O port. This function becomes valid when waveform output from the OUT0 is disabled.
	OUT0		This is an event output pins for output compare 0 (OCU) ch.0. This function is valid when output for each channel is enabled.
3	P33	E	This is a general-purpose I/O port. This function becomes valid when waveform output from the OUT1 is disabled.
	OUT1		This is an event output pins for output compare 0 (OCU) ch.1. This function is valid when output for each channel is enabled.
4	P34	E	This is a general-purpose I/O port. This function becomes valid when waveform output from the OUT2 is disabled.
	OUT2		This is an event output pins for output compare 0 (OCU) ch.2. This function is valid when output for each channel is enabled.
5	P35	E	This is a general-purpose I/O port. This function becomes valid when waveform output from the OUT3 is disabled.
	OUT3		This is an event output pins for output compare 0 (OCU) ch.3. This function is valid when output for each channel is enabled.
6	P36	E	This is a general-purpose I/O port. This function becomes valid when waveform output from the PG00 is disabled.
	PG00		This is an output pin of 8/16-bit PPG timer 0. This function becomes valid when waveform output from PG00 is enabled.

MB90520 Series

Pin no. LQFP-120*1 QFP-120*2	Pin name	Circuit type	Function
7	P37	E	This is a general-purpose I/O port. This function becomes valid when waveform output from the PG01 is disabled.
	PG01		This is an output pin of 8/16-bit PPG timer 0. This function becomes valid when waveform output from PG01 is enabled.
9, 10	P40, P41	D	This is a general-purpose I/O port. This function becomes valid when waveform output from the PG10 and PG11 are disabled. This function can be set by the pull-up resistor setup register (RDR4) for input. For output, however, this function is invalid.
	PG10, PG11		This is an output pin of 8/16-bit PPG timer 1. This function becomes valid when waveform outputs from PG10 and PG11 are enabled.
11	P42	D	This is a general-purpose I/O port. This function can be set by the pull-up resistor setup register (RDR4) for input. For output, however, this function is invalid.
	SIN0		This is a serial data input pin of UART (SCI). Because this input is used as required when UART (SCI) is performing input operations, and it is necessary to stop outputs by other functions unless such outputs are made intentionally. When using other output functions as well, disable output during SIN operation.
12	P43	D	This is a general-purpose I/O port. This function can be set by the pull-up resistor setup register (RDR4) for input. For output, however, this function is invalid.
	SOT2		This is a serial data output pin of UART (SCI). This function becomes valid when serial data output from UART (SCI) is enabled.
13	P44	D	This is a general-purpose I/O port. This function can be set by the pull-up resistor setup register (RDR4) for input. For output, however, this function is invalid.
	SCK0		This is a serial clock I/O pin of UART (SCI). This function becomes valid when serial clock output from UART (SCI) is enabled.
14	P45	D	This is a general-purpose I/O port. This function can be set by the port 4 input pull-up resistor setup register (RDR4) for input. For output, however, this function is invalid.
	SIN1		This is a data input pin for extended I/O serial interface 0. Since this input is used as required for serial data input operation, output by other functions must be suspended except for intentional operation. When using other output functions as well, disable output during SIN operation.

Pin no. LQFP-120*1 QFP-120*2	Pin name	Circuit type	Function
15	P46	E	This is a general-purpose I/O port. This function can be set by the port 4 input pull-up resistor setup register (RDR4) for input. For output, however, this function is invalid.
	SOT1		This is a data output pin for extended I/O serial interface 0. This function becomes valid when serial data output from SOT1 is enabled.
16	P47	D	This is a general-purpose I/O port. This function can be set by the port 4 input pull-up resistor setup register (RDR4) for input. For output, however, this function is invalid.
	SCK1		This is a serial clock I/O pin for extended I/O serial interface 0. This function becomes valid when serial clock output from SCK1 is enabled.
35	P50	D	This is a general-purpose I/O port.
	SIN2		This is a data input pin for extended I/O serial interface 1. Since this input is used as required for serial data input operation, output by other functions must be suspended except for intentional operation.
	AIN1		This port can be used as count A input for 8/16-bit up/down counter/timer 1.
36	P51	D	This is a general-purpose I/O port.
	SOT2		This function becomes valid when serial data output from SOT2 is enabled.
	BIN1		This port can be used as count B input for 8/16-bit up/down counter/timer 1.
37	P52	D	This is a general-purpose I/O port.
	SCK2		This is a serial clock I/O pin for extended I/O serial interface 1. This function becomes valid when serial clock output from serial SCK2 is enabled.
	ZIN1		This port can be used as control clock Z input for 8/16-bit up/down counter/timer 1.
40, 41	P53, P54	I	This is a general-purpose I/O port.
	DA0, DA1		These are analog signal output pins for 8-bit D/A converter ch.0 and ch.1.
46 to 53	P60 to P67	K	This is a general-purpose I/O port. The input function become valid when the analog input enable register (ADER) is set to select a port.
	AN0 to AN7		These are analog input pins of the 8/10-bit A/D converter. This function is valid when the analog input enable register (ADER) is enabled.

Pin no. LQFP-120*1 QFP-120*2	Pin name	Circuit type	Function
55, 57	P70, P72	E	This is a general-purpose I/O port.
	T10, T11		These are event input pins for 16-bit re-load timers 0 and 1. Since this input is used as required for 16-bit re-load timers 0 and 1 operation, output by other functions must be suspended except for intentional operation.
	OUT4, OUT6		These are event output pins for output compare 1 (OCU) ch.4 and ch.6. This function is valid when output for each channel is enabled.
56, 58	P71, P73	E	This is a general-purpose I/O port. This function is valid with TO0 and TO1 output disabled.
	TO0, TO1		These are output pins for 16-bit re-load timers 0 and 1. This function is valid with TO0 and TO1 output is enabled.
	OUT5, OUT7		These are event output pins for output compare 1 (OCU) ch.5 and ch.7. This function is valid when output for each channel is enabled.
59 to 62	P74 to P77	L	This is a general-purpose I/O port. This function is valid with port output specified for the LCD controller/driver control register.
	COM to COM3		These are common pins for the LCD controller/driver. This function is valid with common output specified for the LCD controller/driver control register.
64 to 71	P80 to P87	L	This is a general-purpose I/O port. This function is valid with port output specified for the LCD controller/driver control register.
	SEG16 to SEG23		These are segment outputs for the LCD controller/driver. This function is valid with common output specified for the LCD controller/driver control register.
72, 75 to 81	P90, P91 to P97	M	This is a general-purpose I/O port. The maximum I _{OL} can be 10mA. This function is valid with port output specified for the LCD controller/driver control register.
	SEG24, SEG25 to SEG31		These are ports for the LCD controller/driver. This function is valid with common output specified for the LCD controller/driver control register.
17 to 24	SEG00 to SEG07	F	These are pins dedicated to LCD segments 00 to 07 for the LCD controller/driver.
25 to 32	PA0 to PA7	L	This is a general-purpose I/O port. This function is valid with port output specified for the LCD controller/driver control register.
	SEG08 to SEG15		These are pins for LCD segments 08 to 15 for the LCD controller/driver. Units of four ports or segments can be selected by the internal register in the LCD controller.

Pin no. LQFP-120*1 QFP-120*2	Pin name	Circuit type	Function
34	C	G	This is a capacitance pin for power supply stabilization. Connect an external ceramic capacitor rated at about 0.1 μ F. This capacitor is not, however, required for the M90F523 (flash product).
82 to 85	V0 to V3	N	This is a pin for the reference power supply for the LCD controller/driver.
8, 54, 94	V _{cc}	Power supply	This is power supply (5.0 V) input pin to the digital circuit.
33, 63, 91 119	V _{ss}	Power supply	This provides the GND level (0.0 V) input pin for the digital circuit.
42	AV _{cc}	H	This is power supply to the analog circuit. Make sure to turn on/turn off this power supply with a voltage exceeding AV _{cc} applied to V _{cc} .
43	AVRH	J	This is a reference voltage input to the analog circuit. Make sure to turn on/turn off this power supply with a voltage exceeding AVRH applied to AV _{cc} .
44	AVRL	H	This is a reference voltage input to the analog circuit.
45	AV _{ss}	H	This is a GND level of the analog circuit.
38	DV _{cc}	H	This is the Vref input pin for the D/A converter. The voltage to be applied must not exceed V _{cc} .
39	DV _{ss}	H	This is the GND level pin for the D/A converter. The potential must be the same as V _{ss} .

■ HANDLING DEVICES

1. Make Sure that the Voltage not Exceed the Maximum Rating (to Avoid a Latch-up).

In CMOS ICs, a latch-up phenomenon is caused when an voltage exceeding V_{CC} or an voltage below V_{SS} is applied to input or output pins or a voltage exceeding the rating is applied across V_{CC} and V_{SS} .

When a latch-up is caused, the power supply current may be dramatically increased causing resultant thermal break-down of devices. To avoid the latch-up, make sure that the voltage not exceed the maximum rating.

In turning on/turning off the analog power supply, make sure the analog power voltage (AV_{CC} , $AVRH$, DV_{CC}) and analog input voltages not exceed the digital voltage (V_{CC}).

And also make sure the voltage applied to the LCD power supply pin ($V3$ to $V0$) doesn't exceed the power supply voltage (V_{CC}).

2. Connection of Unused Pins

Leaving unused pins open may result in abnormal operations. Clamp the pin level by connecting it to a pull-up or a pull-down resistor.

3. Notes on Using External Clock

In using the external clock, drive X0 pin only and leave X1 pin unconnected.

• Using external clock

4. Power Supply Pins

In products with multiple V_{CC} or V_{SS} pins, the pins of a same potential are internally connected in the device to avoid abnormal operations including latch-up. However, connect the pins external power and ground lines to lower the electro-magnetic emission level and abnormal operation of strobe signals caused by the rise in the ground level, and to conform to the total current rating.

Make sure to connect V_{CC} and V_{SS} pins via lowest impedance to power lines.

It is recommended to provide a bypass capacitor of around 0.1 μF between V_{CC} and V_{SS} pin near the device.

5. Crystal Oscillator Circuit

Noises around X0 or X1 pins may be possible causes of abnormal operations. Make sure to provide bypass capacitors via shortest distance from X0, X1 pins, crystal oscillator (or ceramic resonator) and ground lines, and make sure, to the utmost effort, that lines of oscillation circuit not cross the lines of other circuits.

It is highly recommended to provide a printed circuit board art work surrounding X0 and X1 pins with an grand area for stabilizing the operation.

MB90520 Series

6. Turning-on Sequence of Power Supply to A/D Converter and Analog Inputs

Make sure to turn on the A/D converter power supply, D/A converter power supply (AV_{CC} , $AVRH$, $AVRL$, DV_{CC} , DV_{SS}) and analog inputs (AN0 to AN7) after turning-on the digital power supply (V_{CC}).

Turn-off the digital power after turning off the A/D converter supply and analog inputs. In this case, make sure that $AVRH$ and DV_{CC} not exceed AV_{CC} (turning on/off the analog and digital supplies simultaneously is acceptable).

7. Connection of Unused Pins of A/D Converter

Connect unused pins of A/D converter and those of D/A converter to $AV_{CC} = DV_{CC} = V_{CC}$, $AV_{SS} = AVRH = AVRL = V_{SS}$.

8. N.C. Pin

The N.C. (internally connected) pin must be opened for use.

9. Notes on Energization

To prevent the internal regulator circuit from malfunctioning, set the voltage rise time during energization at 50 or more μs (0.2 V to 2.7 V).

10. Use of SEG/COM Pins for the LCD Controller/Driver as Ports

In MB90520 series, pins SEG08 to SEG31, and COM0 to COM3 can also be used general-purpose ports. The electrical standard is such that pins SEG08 to SEG23, and COM0 to COM3 have the same ratings as the CMOS output port, while pins SEG24 to SEG31 have the same ratings as the open-drain type.

11. Initialization

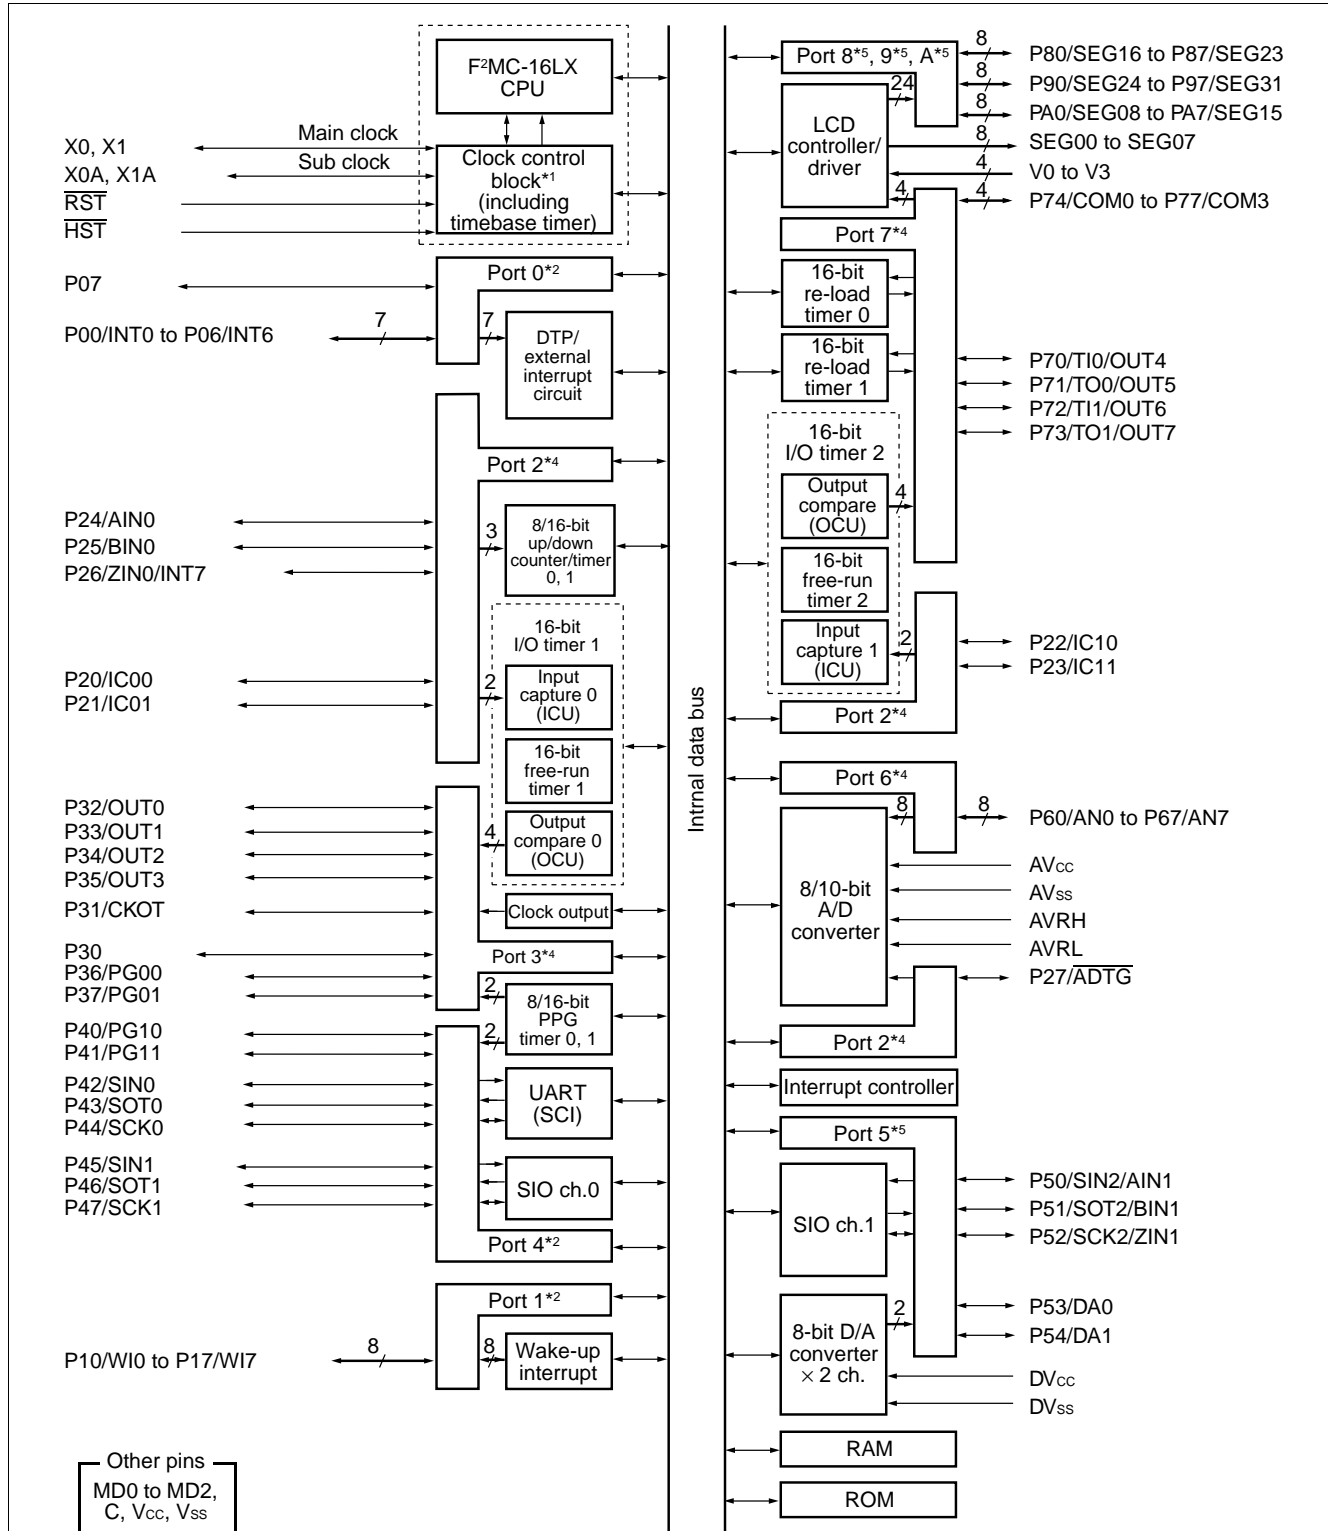

In the device, there are internal registers which is initialized only by a power-on reset. To initialize these registers turning on the power again.

12. Interrupt Recovery from the Standby State

"H" level request must be an input request when using an external interrupt to recover from the standby state. In this case "L" level request may occur malfunction.

MB90520 Series

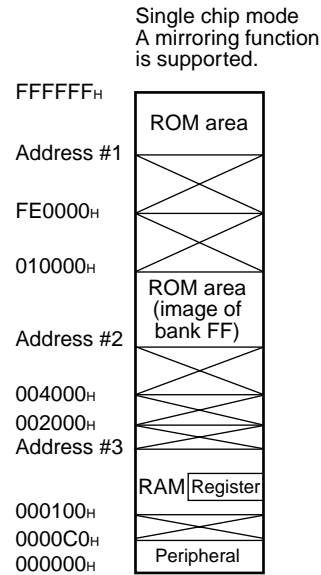

■ BLOCK DIAGRAM

Notes: One 16-bit free-run timer 1 is supported although two free-run timers are seemingly supported.
 *1: The clock control circuit comprises a watchdog timer, a timebase timer, and a power consumption controller.
 *2: A register for setting a pull-up resistor is supported.
 *3: This is a high-current port for LCD drive.
 *4: A register for setting a pull-up resistor is supported. A signal in the CMOS level is input and output.
 *5: Also used for LCD output. With this port used as is, N-ch open-drain output develops. A register for setting a pull-up resistor.

MB90520 Series

■ MEMORY MAP

Part number	Address #1*	Address #2*	Address #3*
MB90522	FF0000H	004000H	001100H
MB90523	FE0000H	004000H	001100H
MB90F523	FE0000H	004000H	001100H

□ : Internal access memory
 ⊗ : Access prohibited

*: Addresses #1, #2 and #3 are unique to the product type.

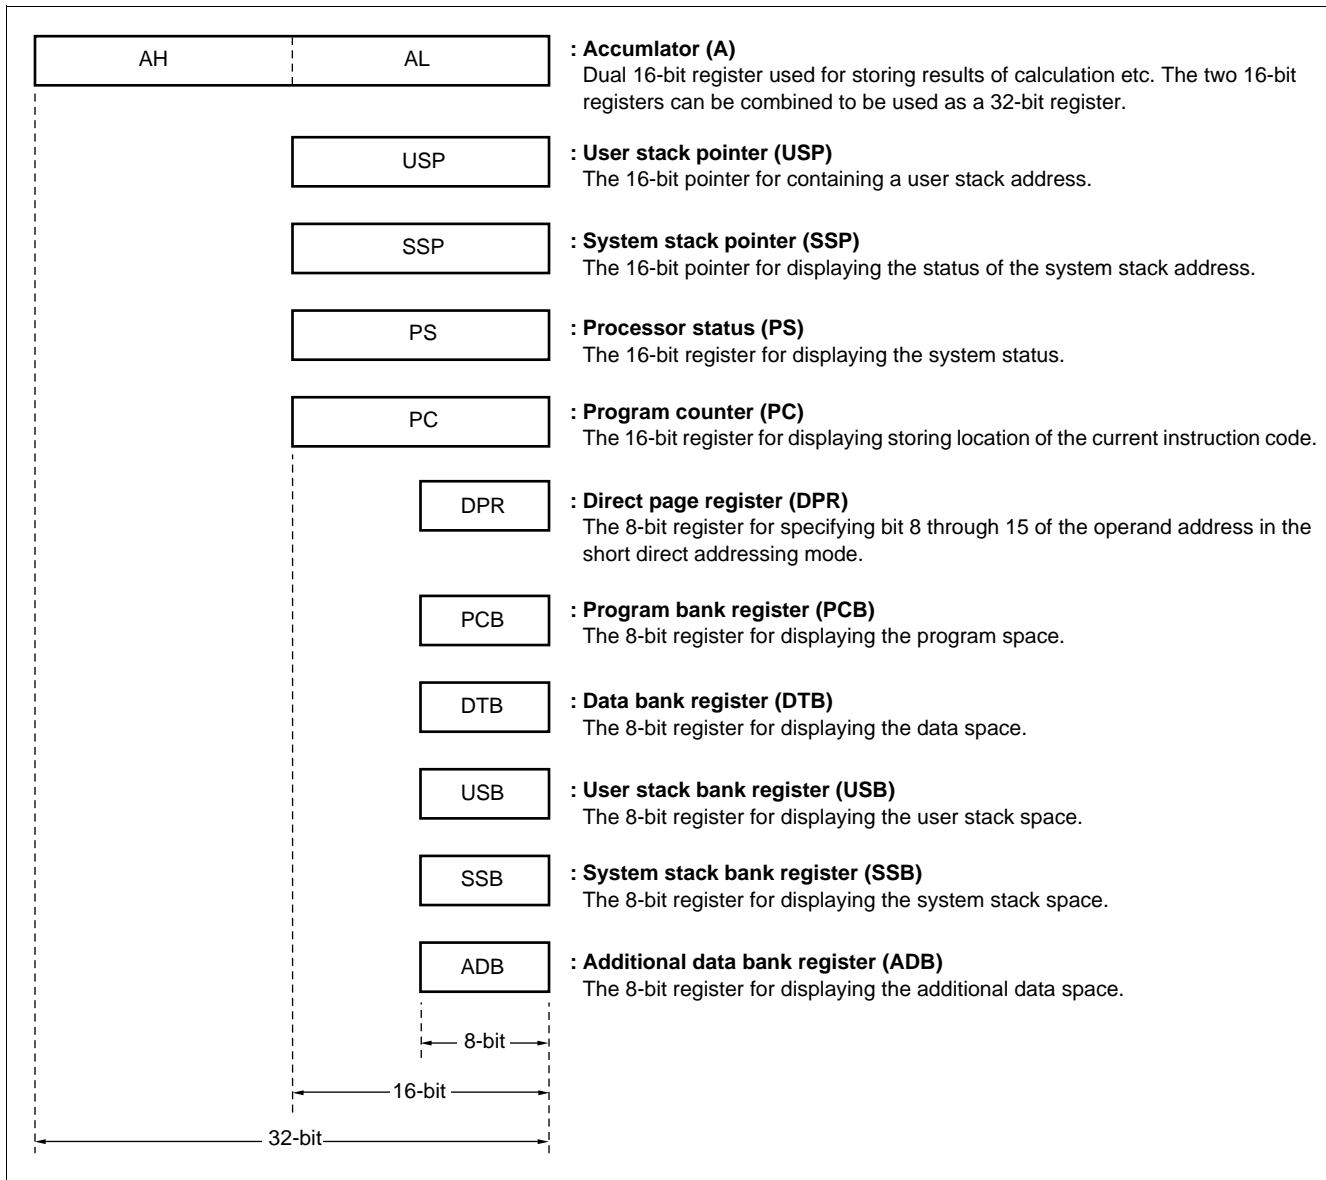

Note: The ROM data of bank FF is reflected in the upper address of bank 00, realizing effective use of the C compiler small model. The lower 16-bit of bank FF and the lower 16-bit of bank 00 is assigned to the same address, enabling reference of the table on the ROM without stating "far".

For example, if an attempt has been made to access 00C000H, the contents of the ROM at FFC000H are accessed actually. Since the ROM area of the FF bank exceeds 48k bytes, the whole area cannot be reflected in the image for the 00 bank. The ROM data at FF4000H to FFFFFFFH looks, therefore, as if it were the image for 00400H to 00FFFFH. Thus, it is recommended that the ROM data table be stored in the area of FF4000H to FFFFFFFH

Descriptions for read/write

R/W: Readable and writable

R: Read only

W: Write only

MB90520 Series

Descriptions for initial value

- 0 : The initial value of this bit is "0".
- 1 : The initial value of this bit is "1".
- X : The initial value of this bit is indeterminate.
- : This bit is not used. The initial value is indeterminate.

- *1: This area is the only external access area having an address of 0000FF_H or lower. An access operation to this area is handled as that to external I/O area.
- *2: For details of the RAM area, see the memory map.
- *3: The reserved area is basically disabled because it is used in the system.
- *4: Area used by the system is the area set by the resistor for evaluating tool.

- Notes:
- For bits that is initialized by a reset operation, the initial value set by the reset operation is listed as an initial value. Note that the values are different from reading results.
For LPMCR/CKSCR/WDTC, there are cases where initialization is performed or not performed, depending on the types of the reset. However initial value for resets that initializes the value are listed.
 - The addresses following 0000FF_H are reserved. No external bus access signal is generated.
 - Boundary #####_H between the RAM area and the reserved area varies with the product model.
 - Channels 0 to 3 of the OCU compare register use 16-bit free-run timer 2, while channels 4 to 7 of the OCU compare register use 16-bit free-run timer 1. 16-bit free-run timer 1 is also used by input captures (ICU) 0 and 1.

MB90520 Series

■ PERIPHERALS

1. I/O Port

(1) Input/Output Port

Port 0 through 8, A are general-purpose I/O ports having a combined function as a resource input. The input output ports function as general-purpose I/O port only in the single-chip mode.

- Operation as output port

The pin is configured as an output port by setting the corresponding bit of the DDR register to “1”.

Writing data to PDR register when the port is configured as output, the data is retained in the output latch in the PDR and directly output to the pin.

The value of the pin (the same value retained in the output latch of PDR) can be read out by reading the PDR register.

Note: When a read-modify-write type instruction (e.g. bit set instruction) is performed to the port data register, the destination bit of the operation is set to the specified value, not affecting the bits configured by the DDR register for output, however, values of bits configured by the DDR register as inputs are changed because input values to the pins are written into the output latch. To avoid this situation, configure the pins by the DDR register as output after writing output data to the PDR register when configuring the bit used as input as outputs.

- Operation as input port

The pin is configured as an input by setting the corresponding bit of the DDR register to “0”.

When the pin is configured as an input, the output buffer is turned-off and the pin is put into a high-impedance status.

When a data is written into the PDR register, the data is retained in the output latch of the PDR, but pin outputs are unaffected.

Reading the PDR register reads out the pin level (“0” or “1”).

2. Timebase Timer

The timebase timer is a 18-bit free-run counter (timebase counter) for counting up in synchronization to the internal count clock (divided-by-2 of oscillation) with an interval timer function for selecting an interval time from four types of $2^{12}/HCLK$, $2^{14}/HCLK$, $2^{16}/HCLK$, and $2^{19}/HCLK$.

The timebase timer also has a function for supplying operating clocks for the timer output for the oscillation stabilization time or the watchdog timer etc.

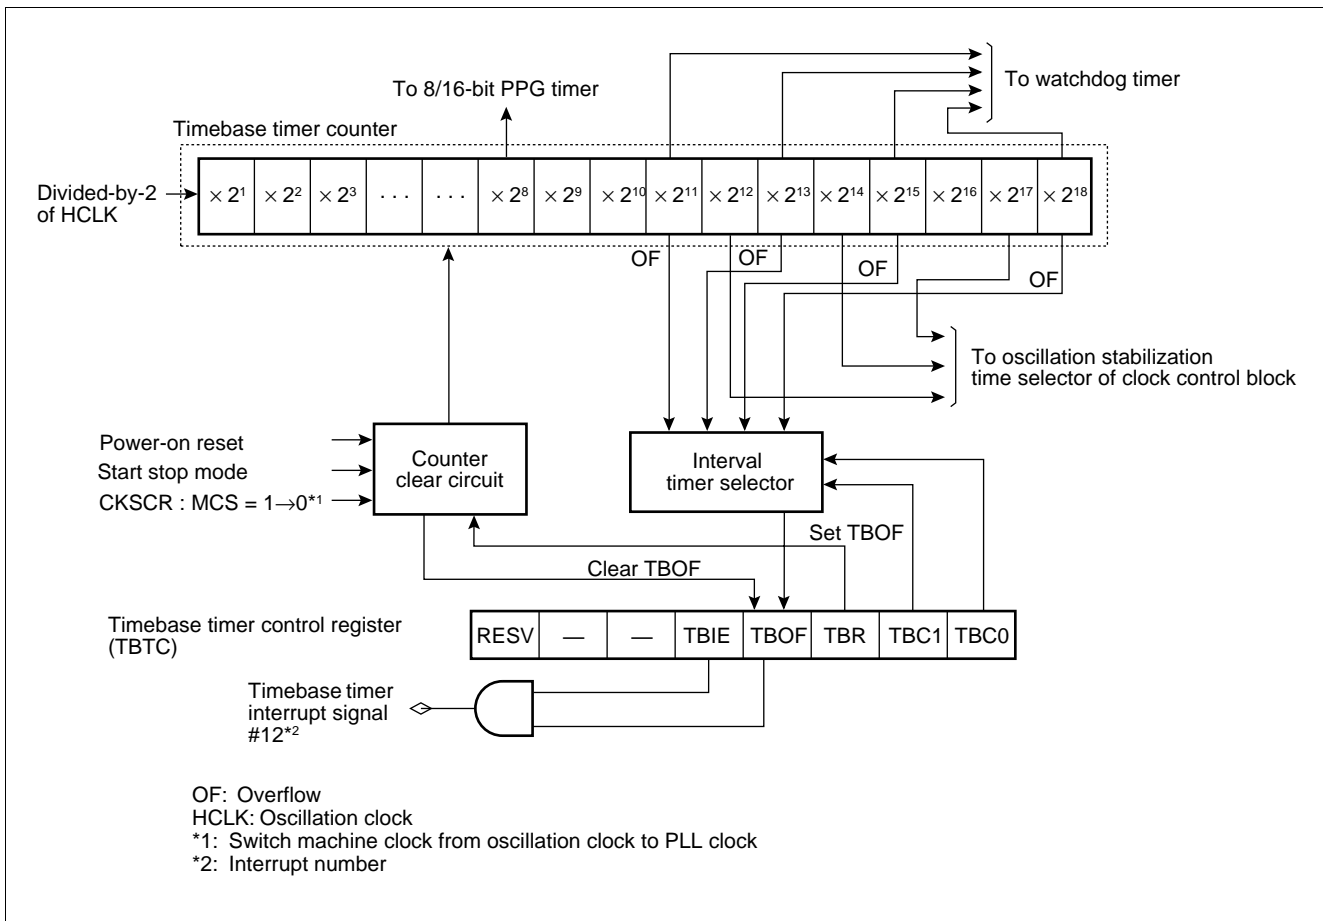

(1) Register Configuration

4. 8/16-bit PPG Timer 0, 1

The 8/16-bit PPG timer is a 2-CH re-load timer module for outputting pulse having given frequencies/duty ratios.

The two modules performs the following operation by combining functions.

- 8-bit PPG output 2-CH independent operation mode
This is a mode for operating independent 2-CH 8-bit PPG timer, in which PPG0 and PPG1 pins correspond to outputs from PPG0 and PPG1 respectively.
- 16-bit PPG timer output operation mode
In this mode, PPG0 and PPG1 are combined to be operated as a 1-CH 8/16-bit PPG timer 0 and 1 operating as a 16-bit timer. Because PPG0 and PPG1 outputs are reversed by an underflow from PPG1 outputting the same output pulses from PPG0 and PPG1 pins.
- 8 + 8-bit PPG timer output operation mode
In this mode, PPG0 is operated as an 8-bit communications pre-scaler, in which an underflow output of PPG0 is used as a clock source for PPG1. A toggle output of PPG0 and PPG output of PPG1 are output from PPG0 and PPG1 respectively.
- PPG output operation
A pulse wave with any period/duty ratio is output. The module can also be used as a D/A converter with an external add-on circuit.

5. 16-bit Re-load Timer 0, 1 (With an Event Count Function)

The 16-bit re-load timer has an internal clock mode for counting down in synchronization to three types of internal clocks and an event count mode for counting down detecting a given edge of the pulse input to the external bus pin, and either of the two functions can be selectively used.

For this timer, an “underflow” is defined as the timing of transition from the counter value of “0000H” to “FFFFH”. According to this definition, an underflow occurs after [re-load register setting value + 1] counts.

In operating the counter, the re-load mode for repeating counting operation after re-loading a counter value after an underflow or the one-shot mode for stopping the counting operation after an underflow can be selectively used.

Because the timer can generate an interrupt upon an underflow, the timer conforms to the extended intelligent I/O service (EI²OS).

The MB90520 series has 2 channels of 16-bit re-load timers.

(1) Register Configuration

MB90520 Series

6. 16-bit I/O Timer

The 16-bit I/O timer module consists of two 16-bit free-run timer, two input capture circuits (ICU), and eight output comparators (OCU). This module allows two independent waveforms to be output on the basis of the 16-bit free-run timer. Input pulse width and external clock periods can, therefore, be measured.

- **Block diagram**

MB90520 Series

(1) 16-bit Free-run Timer 1, 2

The 16-bit free-run timer consists of a 16-bit up counter, a control register, and a communications prescaler register. The value output from the timer counter is used as basic timer (base timer) for input capture (ICU) and output compare (OCU).

- A counter operation clock can be selected from four internal clocks ($\phi/4$, $\phi/16$, $\phi/32$ and $\phi/64$).
- An interrupt can be generated by overflow of counter value or compare match with OCU compare register 0 and 4. (Compare match requires mode setup.)
- The counter value can be initialized to "0000H" by a reset, software clear or compare match with OCU compare register 0 and 4.

• Register configuration

- Free-run timer data register 1, 2 (TCDT1, TCDT2)

Address	bit 15	bit 14	bit 13	bit 12	bit 11	bit 10	bit 9	bit 8	bit 7	bit 6	bit 5	bit 4	bit 3	bit 2	bit 1	bit 0	Initial value

MB90520 Series

(2) Input Capture 0, 1 (ICU)

The input capture (ICU) generates an interrupt request to the CPU simultaneously with a storing operation of current counter value of the 16-bit free-run timer to the ICU data register (IPCP) upon an input of a trigger edge to the external pin.

There are two sets (two channels) of the input capture external pins and ICU data registers, enabling measurements of maximum of four events.

- The input capture has two sets of external input pins (IN0, IN1) and ICU registers (IPCP), enabling measurements of maximum of four events.
- A trigger edge direction can be selected from rising/falling/both edges.
- The input capture can be set to generate an interrupt request at the storage timing of the counter value of the 16-bit free-run timer to the ICU data register (IPCP).
- The input compare conforms to the extended intelligent I/O service (EI²OS).
- The input capture (ICU) function is suited for measurements of intervals (frequencies) and pulse-widths.

• Register configuration

- ICU data register ch.0 ch.1 (IPCP0, IPCP1)

Address	bit 15	bit 14	bit 13	bit 12	bit 11	bit 10	bit 9	bit 8	bit 7	bit 0	Initial value

MB90520 Series

(3) Output Compare 0, 1 (OCU)

The output compare (OCU) is two sets of compare units consisting of a eight-channel OCU compare registers, a comparator and a control register.

An interrupt request can be generated for each channel upon a match detection by performing time-division comparison between the OCU compare data register setting value and the counter value of the 16-bit free-run timer.

The OUT pin can be used as a waveform output pin for reversing output upon a match detection or a general-purpose output port for directly outputting the setting value of the CMOD bit.

• Register Configuration

9. UART (SCI)

UART (SCI) is general-purpose serial data communication interface for performing synchronous or asynchronous communication (start-stop synchronization system).

- Data buffer: Full-duplex double buffer
- Transfer mode: Clock synchronized (with start and stop bit)
Clock asynchronous (start-stop synchronization system)
- Baud rate: Embedded dedicated baud rate generator
External clock input possible
Internal clock (a clock supplied from 16-bit re-load timer can be used.)
Asynchronization 9615 bps/31250 bps/4808 bps/2404 bps/1202 bps } Internal machine clock
CLK synchronization 1 Mbps/500 kbps/250 kbps/125 kbps/62.5 kbps } For 6 MHz, 8 MHz, 10 MHz,
12 MHz and 16 MHz
- Data length: 7 bit to 9 bit selective (without a parity bit)
6 bit to 8 bit selective (with a parity bit)
- Signal format: NRZ (Non Return to Zero) system
- Reception error detection: Framing error
Overrun error
Parity error (multi-processor mode is supported, enabling setup of any baud rate by an external clock.)
- Interrupt request: Receive interrupt (receive complete, receive error detection)
Receive interrupt (transmit complete)
Transmit/receive conforms to extended intelligent I/O service (EI²OS)

10. DTP/External Interrupt Circuit

DTP (Data Transfer Peripheral), which is located between the peripheral circuit outside the device and the F²MC-16LX CPU, receives an interrupt request or DMA request generated by the external peripheral circuit* for transmission to the F²MC-16LX CPU. DTP is used to activate the intelligent I/O service or interrupt processing. As request levels, two types of “H” and “L” can be selected for the intelligent I/O service. Rising and falling edges as well as “H” and “L” can be selected for an external interrupt request.

* : The external peripheral circuit is connected outside the MB90520 series device.

(1) Register Configuration

11. Wake-up Interrupt

Wake-up interrupt transmits interrupt request ("L" level) generated by peripheral equipment located between external peripheral devices and the F²MC-16LX CPU to the CPU and invokes interrupt processing.

The interrupt does not conform to the extended intelligent I/O service (EI²OS).

(1) Register Configuration

- Wake-up interrupt flag register (EIFR)

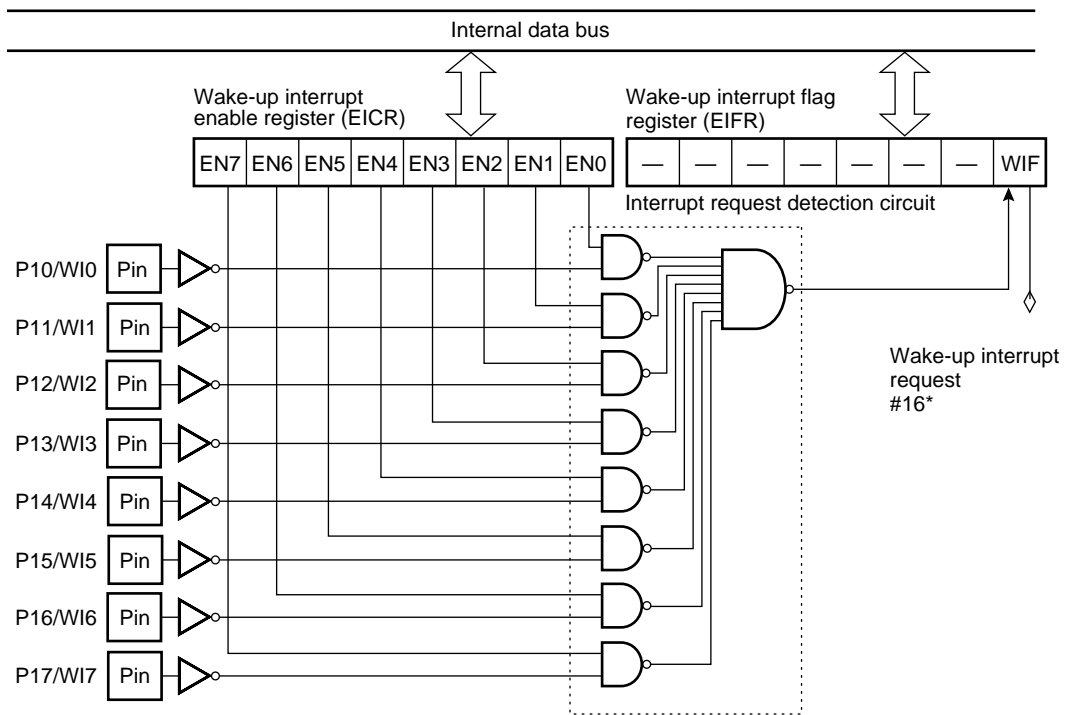

- Wake-up interrupt enable register (EICR)

R/W: Readable and writable
 W : Write only
 — : Unused

(2) Block Diagram

*: Interrupt number

MB90520 Series

12. Delayed Interrupt Generation Module

The delayed interrupt generation module generates interrupts for switching tasks for development on a real-time operating system (REALOS series). The module can be used to generate softwarewise generates hardware interrupt requests to the CPU and cancel the interrupts.

This module does not conform to the extended intelligent I/O service (EI²OS).

(1) Register Configuration

• Delayed interrupt factor generation/cancellation register (DIRR)

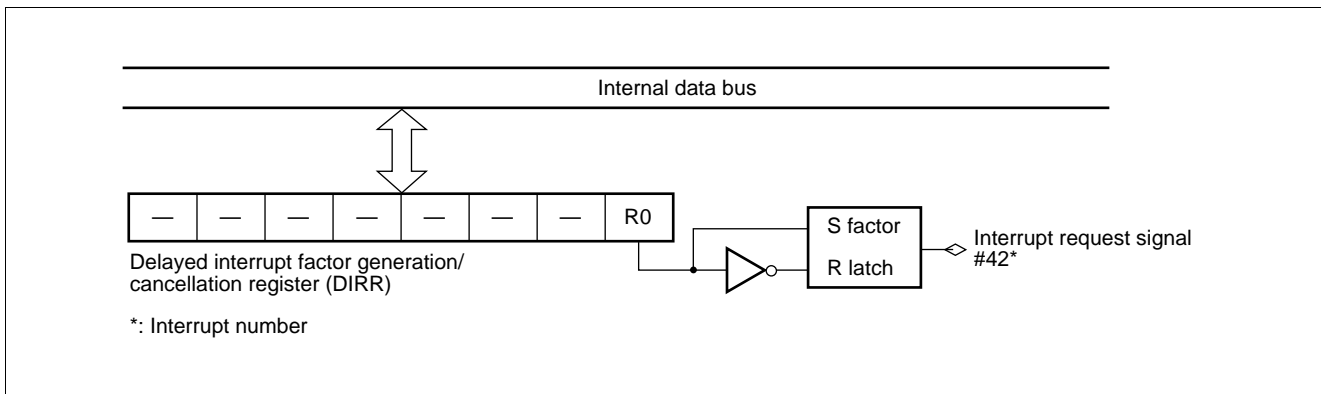

Note: Upon a reset, an interrupt is canceled.

R/W: Readable and writable
— : Unused

The DIRR is the register used to control delay interrupt request generation/cancellation. Programming this register with “1” generates a delay interrupt request. Programming this register with “0” cancels a delay interrupt request. Upon a reset, an interrupt is canceled. The reserved bit area can be programmed with either “0” or “1”. For future extension, however, it is recommended that bit set and clear instructions be used to access this register.

(2) Block Diagram

13. 8/10-bit A/D Converter

The 8/10-bit A/D converter has a function of converting analog voltage input to the analog input pins (input voltage) to digital values (A/D conversion) and has the following features.

- Minimum conversion time: 16.3 μ s (at machine clock of 16 MHz, including sampling time)
- Minimum sampling period: 4 μ s/8 μ s/16 μ s/256 μ s (at machine clock of 16 MHz)
- Compare time: 99/176 machine cycles per channel.
(99 machine cycles are used for a machine clock below 10 MHz.)
- Conversion method: RC successive approximation method with a sample and hold circuit.
- 8/10-bit resolution
- Analog input pins: Selectable from eight channels by software
 - Single conversion mode: Selects and converts one channel.
 - Scan conversion mode: Converts two or more successive channels. Up to eight channels can be programmed.
 - Continuous conversion mode: Repeatedly converts specified channels.
 - Stop conversion mode: Stops conversion after completing a conversion for one channel and wait for the next activation (conversion can be started synchronously.)
- Interrupt requests can be generated and the extended intelligent I/O service (EI²OS) can be started after the end of A/D conversion. Furthermore, A/D conversion result data can be transferred to the memory, enabling efficient continuous processing.
- When interrupts are enabled, there is no loss of data even in continuous operations because the conversion data protection function is in effect.
- Starting factors for conversion: Selected from software activation, and external trigger (falling edge).

18. Address Match Detection Function

When the address is equal to a value set in the address detection register, the instruction code loaded into the CPU is replaced forcibly with the INT9 instruction code (01H). As a result, when the CPU executes a set instruction, the INT9 instruction is executed. Processing by the INT#9 interrupt routine allows the program patching function to be implemented.

Two address detection registers are supported. An interrupt enable bit and flag are prepared for each register. If the value set in the address detection register matches an address and if the interrupt enable bit is set at "1", the interrupt flag is set at "1" and the instruction code loaded into the CPU is replaced forcibly with the INT9 instruction code. The interrupt flag is cleared to "0" by writing 0 by an instruction.

(1) Register Configuration

- Program address detection register 0 to 2 (PADR0)

20. Low-power Consumption (Stand-by) Mode

The F²MC-16LX has the following CPU operating mode configured by selection of an operating clock and clock operation control.

- **Clock mode**

PLL clock mode: A mode in which the CPU and peripheral equipment are driven by PLL-multiplied oscillation clock (HCLK).

Main clock mode: A mode in which the CPU and peripheral equipment are driven by divided-by-2 of the oscillation clock (HCLK).

The PLL multiplication circuits stops in the mainclock mode.

- **CPU intermittent operation mode**

The CPU intermittent operation mode is a mode for reducing power consumption by operating the CPU intermittently while external bus and peripheral functions are operated at a high-speed.

- **Hardware stand-by mode**

The hardware standby mode is a mode for reducing power consumption by stopping clock supply to the CPU by the low-power consumption control circuit, stopping clock supplies to the CPU and peripheral functions (timebase timer mode), and stopping oscillation clock (stop mode, hardware standby mode). Of these modes, modes other than the PLL clock mode are power consumption modes.

(1) Register Configuration

1. Absolute Maximum Ratings

($V_{SS} = V_{SS} = 0.0\text{ V}$)

Parameter	Symbol	Value		Unit	Remarks
		Min.	Max.		
Power supply voltage	V_{CC}	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	
	AV_{CC}	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	*1
	AV_{RH} , AV_{RL}	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	*1
	DV_{CC}	$V_{SS} - 0.3$	$V_{SS} + 6.0$	V	*1
Input voltage	V_I	$V_{SS} - 0.3$	$V_{CC} + 6.0$	V	*2
Output voltage	V_O	$V_{SS} - 0.3$	$V_{CC} + 6.0$	V	*2
"L" level maximum output current	I_{OL}	—	15	mA	*3
"L" level average output current	I_{OLAV}	—	4	mA	*4
"L" level total maximum output current	ΣI_{OL}	—	100	mA	
"L" level total average output current	ΣI_{OLAV}	—	50	mA	*5
"H" level maximum output current	I_{OH}	—	-15	mA	*3
"H" level average output current	I_{OHAV}	—	-4	mA	*4
"H" level total maximum output current	ΣI_{OH}	—	-100	mA	
"H" level total average output current	ΣI_{OHAV}	—	-50	mA	*5
Power consumption	P_D	—	300	mW	
Operating temperature	T_A	-40	+85	°C	
Storage temperature	T_{stg}	-55	+150	°C	

*1: AV_{CC} , AV_{RH} , AV_{RL} , and DV_{CC} shall never exceed V_{CC} . AV_{RL} shall never exceed AV_{RH} .

*2: V_I and V_O shall never exceed $V_{CC} + 0.3\text{ V}$.

*3: The maximum output current is a peak value for a corresponding pin.

*4: Average output current is an average current value observed for a 100 ms period for a corresponding pin.

*5: Total average current is an average current value observed for a 100 ms period for all corresponding pins.

Note: Average output current = operating current \times operating efficiency

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

MB90520 Series

2. Recommended Operating Conditions

($V_{SS} = V_{SS} = 0.0\text{ V}$)

Parameter	Symbol	Value		Unit	Remarks
		Min.	Max.		
Power supply voltage	V_{CC}	3.0	5.5	V	Normal operation (MB90523)
	V_{CC}	4.5	5.5	V	Normal operation (MB90F523) Guaranteed frequency = 10 MHz at 4.0 V to 4.5V
	V_{CC}	3.0	5.5	V	Retains status at the time of operation stop
Smoothing capacitor	C_s	0.1	1.0	μF	*
Operating temperature	T_A	-40	+85	$^{\circ}\text{C}$	

* : Use a ceramic capacitor or a capacitor with equivalent frequency characteristics. The smoothing capacitor to be connected to the V_{CC} pin must have a capacitance value higher than C_s .

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

• Measurement conditions for AC ratings

C_L is a load capacitance connected to a pin under test.

Capacitors of $C_L = 30 \text{ pF}$ must be connected to CLK and ALE pins, while C_L of 80 pF must be connected to address data bus (AD15 to AD00), \overline{RD} , and \overline{WR} pins.

MB90520 Series

(2) Specification for Power-on Reset

($V_{SS} = V_{SS} = 0.0\text{ V}$, $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value		Unit	Remarks
				Min.	Max.		
Power supply rising time	t_R	V_{CC}	—	0.05	30	ms	*
Power supply cut-off time	t_{OFF}	V_{CC}	—	4	—	ms	Due to repeated operations

* : V_{CC} must be kept lower than 0.2 V before power-on.

- Notes:
- The above ratings are values for causing a power-on reset.
 - When $\overline{\text{HST}}$ is set to "L", apply power according to this table to cause a power-on reset irrespective of whether or not a power-on reset is required.
 - There are internal registers which can be initialized only by a power-on reset. Apply power according to this rating to ensure initialization of the registers.

Sudden changes in the power supply voltage may cause a power-on reset. To change the power supply voltage while the device is in operation, it is recommended to raise the voltage smoothly to suppress fluctuations as shown below. In this case, change the supply voltage with the PLL clock not used. If the voltage drop is 1 mV or fewer per second, however, you can use the PLL clock.

MB90520 Series

(3) Clock Timings

($A_{V_{CC}} = V_{CC} = 5.0 \text{ V} \pm 10\%$, $A_{V_{SS}} = V_{SS} = 0.0 \text{ V}$, $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$)

Parameter	Symbol	Pin name	Condition	Value			Unit	Remarks
				Min.	Typ.	Max.		
Clock frequency	F_C	X0, X1	—	3	—	16	MHz	
	F_C	X0, X1	4.0 V to 4.5 V	3	—	10	MHz	MB90F523
	F_{CL}	X0A, X1A	—	—	32.768	—	kHz	
Clock cycle time	t_{HCYL}	X0, X1	—	62.5	—	333	ns	
	t_{HCYL}	X0, X1	4.0 V to 4.5 V	100	—	333	ns	MB90F523
	t_{LCYL}	X0A, X1A	—	—	30.5	—	μs	
Input clock pulse width	P_{WH}, P_{WL}	X0	—	10	—	—	ns	Recommended duty ratio of 30% to 70%
	P_{WLH}, P_{WLL}	X0A	—	—	15.2	—	μs	
Input clock rising/falling time	t_{CR}, t_{CF}	X0, X0A	—	—	—	5	ns	External clock operation
Internal operating clock frequency	f_{CP}	—	—	1.5	—	16	MHz	When the main clock is used
	f_{CP}	—	4.0 V to 4.5 V	1.5	—	10	MHz	When the main clock is used
	f_{LCP}	—	—	—	8.192	—	kHz	Subclock operation
Internal operating clock cycle time	t_{CP}	—	—	62.5	—	333	ns	When the main clock is used
	t_{CP}	—	4.0 V to 4.5 V	100	—	333	ns	When the main clock is used
	t_{LCP}	—	—	—	122.1	—	μs	Subclock operation
Frequency fluctuation rate locked	Δf	—	—	—	—	5	%	*

* : The frequency fluctuation rate is the maximum deviation rate of the preset center frequency when the multiplied PLL signal is locked.

The PLL frequency deviation changes periodically from the preset frequency “(about $\text{CLK} \times (1\text{CYC}$ to $50\text{CYC})$ ”, thus minimizing the chance of worst values to be repeated (errors are minimal and negligible for pulses with long intervals).

6. A/D Converter Glossary

Resolution: Analog changes that are identifiable with the A/D converter

Linearity error: The deviation of the straight line connecting the zero transition point ("00 0000 0000" ↔ "00 0000 0001") with the full-scale transition point ("11 1111 1110" ↔ "11 1111 1111") from actual conversion characteristics

Differential linearity error: The deviation of input voltage needed to change the output code by 1 LSB from the theoretical value

Total error: The total error is defined as a difference between the actual value and the theoretical value, which includes zero-transition error/full-scale transition error and linearity error.

$$1 \text{ LSB}' = (\text{Theoretical value}) \frac{\text{AVRH} - \text{AVRL}}{1024} \text{ [V]}$$

$$V_{0T}' (\text{Theoretical value}) = \text{AVRL} + 0.5 \text{ LSB}' \text{ [V]}$$

$$V_{FST}' (\text{Theoretical value}) = \text{AVRH} - 1.5 \text{ LSB}' \text{ [V]}$$

$$\text{Total error for digital output } N = \frac{V_{NT} - \{1 \text{ LSB} \times (N - 1) + 0.5 \text{ LSB}\}}{1 \text{ LSB}'} \text{ [LSB]}$$

V_{NT} : Voltage at a transition of digital output from (N - 1) to N

(Continued)

MB90520 Series

(Continued)

7. Notes on Using A/D Converter

The impedance value of about 5 kΩ or lower for the external circuit of analog input are recommended.

When capacitors are connected to external pins, the capacitance of several thousand times the internal capacitor value is recommended to minimized the effect of voltage distribution between the external capacitor and internal capacitor.

When the output impedance of the external circuit is too high, the sampling period for analog voltages may not be sufficient (sampling period = 4.00 μs @ machine clock of 16 MHz).

• Block diagram of analog input circuit model

MB90523
 R_{ON} : Approx. 1.5 kΩ
 C : Approx. 3.0 pF
 MB90F523
 R_{ON} : Approx. 3.0 kΩ
 C : Approx. 65 pF

Note: Listed values must be considered as standards.

• Error

The smaller the $|AVRH - AVRL|$, the greater the error would become relatively.

MB90520 Series

8. D/A Converter Electrical Characteristics

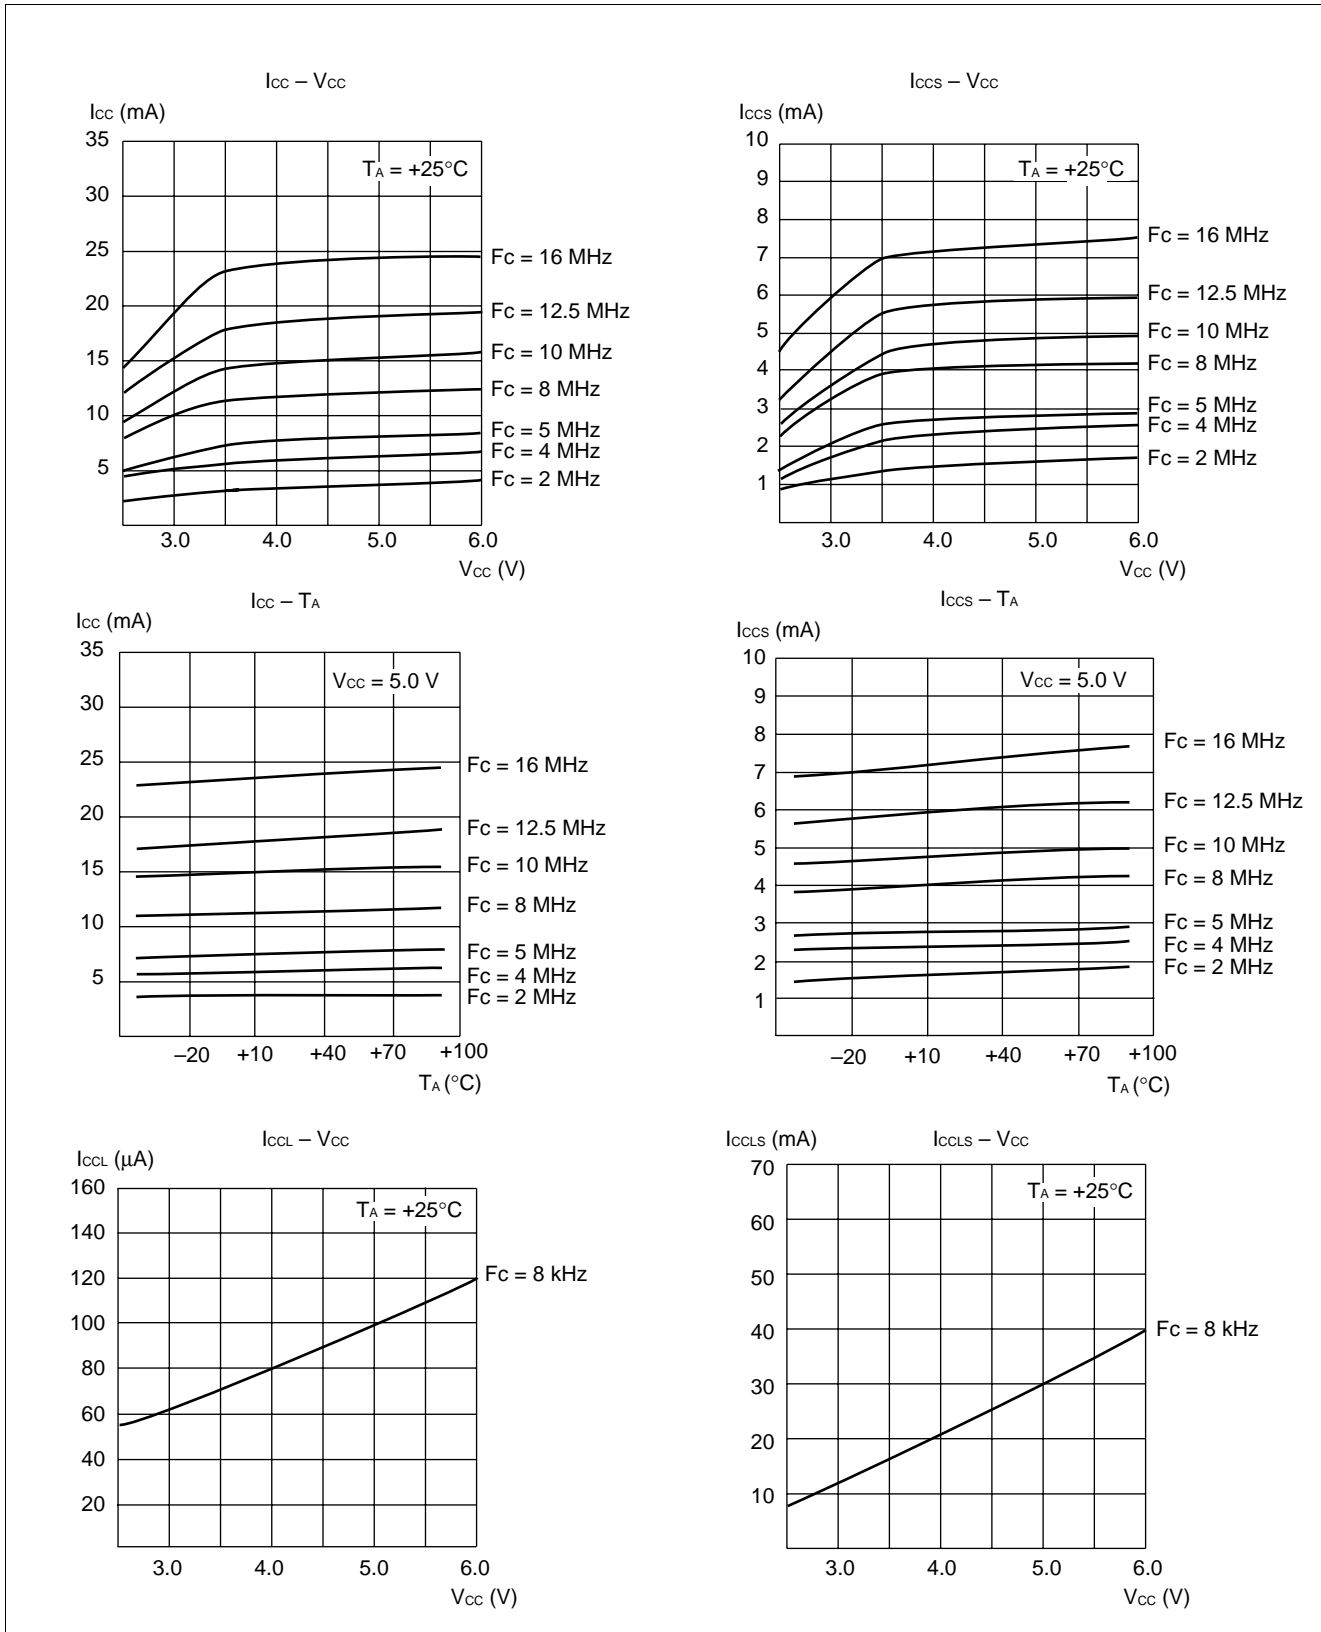

($AV_{CC} = V_{CC} = DV_{CC} = 5.0\text{ V} \pm 10\%$, $AV_{SS} = V_{SS} = DV_{SS} = 0.0\text{ V}$, $T_A = -40^\circ\text{C}$ to $+85^\circ\text{C}$)

■ INSTRUCTIONS (340 INSTRUCTIONS)

Table 1 Description of items in instruction list

Item	Description
Mnemonic	English upper case and symbol: Described directly in assembler code. English lower case: Converted in assembler code. Number of letters after English lower case: Describes bit width in code.
#	Describes number of bytes.
~	Describes number of cycles. m : For branch operation n : For non-branch operation For other letters in other items, refer to table 4.
RG	Describes the number of times the register is accessed during instruction execution. Used to calculate a corrective value for CPU intermittent operation.
B	Describes correction value for calculating number of actual cycles (refer to table 5). Number of actual cycles is calculated by adding values in the ~-section and section B.
Operation	Describes operation of instructions.
LH	Describes a special operation to the upper 8-bit of the lower 16-bit of the accumulator. Z : Transfer 0. X : Sign-extend and transfer. - : No transmission
AH	Describes a special operation to the upper 16-bit of the accumulator. * : Transmit from AL to AH. - : No transfer. Z : Transfer 00 _H to AH. X : Sign-extend AL and transfer 00 _H or FF _H to AH.
I	Describe status of I (interrupt enable), S (stack), T (sticky bit), N (negative), Z (zero), V (overflow), and C (carry) flags. * : Changes after execution of instruction. - : No changes. S : Set after execution of instruction. R : Reset after execution of instruction.
S	
T	
N	
Z	
V	
C	
RMW	Describes whether or not the instruction is a read-modify-write type (a data is read out from memory etc. in single cycle, and the result is written into memory etc.). * : Read-modify-write instruction - : Not read-modify-write instruction Note: Not used to addresses having different functions for reading and writing operations.

• Number of execution cycles

The number of cycles required for instruction execution is acquired by adding the number of cycles for each instruction, a corrective value depending on the condition, and the number of cycles required for program fetch. Whenever the instruction being executed exceeds the two-byte (word) boundary, a program on an internal ROM connected to a 16-bit bus is fetched. If data access is interfered with, therefore, the number of execution cycles is increased.

For each byte of the instruction being executed, a program on a memory connected to an 8-bit external data bus is fetched. If data access is interfered with, therefore, the number of execution cycles is increased. When a general-purpose register, an internal ROM, an internal RAM, an internal I/O device, or an external bus is accessed during intermittent CPU operation, the CPU clock is suspended by the number of cycles specified by the CG1/0 bit of the low-power consumption mode control register. When determining the number

MB90520 Series

of cycles required for instruction execution during intermittent CPU operation, therefore, add the value of the number of times access is done × the number of cycles suspended as the corrective value to the number of ordinary execution cycles.

Table 2 Description of Symbols in Instruction Table

Item	Description
A	32-bit accumulator The bit length is dependent on the instructions to be used. Byte : Lower 8-bit of AL Word : 16-bit of AL Long : AL: 32-bit of AH
AH AL	Upper 16-bit of A Lower 16-bit of A
SP	Stack pointer (USP or SSP)
PC	Program counter
PCB	Program bank register
DTB	Data bank register
ADB	Additional data bank register
SSB	System stack bank register
USB	User stack bank register
SPB	Current stack bank register (SSB or USB)
DPR	Direct page register
brg1	DTB, ADB, SSB, USB, DPR, PCB, SPB
brg2	DTB, ADB, SSB, USB, DPR, SPB
Ri	R0, R1, R2, R3, R4, R5, R6, R7
RWi	RW0, RW1, RW2, RW3, RW4, RW5, RW6, RW7
RWj	RW0, RW1, RW2, RW3
RLi	RL0, RL1, RL2, RL3
dir	Specify shortened direct address.
addr16 addr24 ad24 0 to 15 ad24 16 to 23	Specify direct address. Specify physical direct address. bit0 to bit15 of addr24 bit16 to bit 23 of addr24

1D	@RW1 + RW7			Register indirect with index	0
1E	@PC + disp16			PC indirect with 16-bit displacement	2
1F	addr16			Direct address	2

Note: Number of bytes for address extension corresponds to "+" in the # (number of bytes) the number of bytes in detailed instruction rules part in the instruction table.

MB90520 Series

Table 4 Number of Execution Cycles for Effective Address in Addressing Modes

Code	Operand	(a)	Number of register accesses for addressing modes
		Number of execution cycles for addressing modes	
00 to 07	Ri RWi RLi	Listed in instruction table	Listed in instruction table
08 to 0B	@RWj	2	1
0C to 0F	@RWj +	4	2
10 to 17	@RWi + disp8	2	1
18 to 1B	@RWj + disp16	2	1
1C	@RW0 + RW7	4	2
1D	@RW1 + RW7	4	2
1E	@PC + disp16	2	0
1F	addr16	1	0

Note: (a) is used for ~ (number of cycles) and B (correction value) detailed instruction rules in instruction table.

Table 5 Correction Value for Number of Cycles for Calculating Actual Number of Cycles

Operand	(b) byte		(c) word		(d) long	
	Number of cycles	Number of access	Number of cycles	Number of access	Number of cycles	Number of access
Internal register	+0	1	+0	1	+0	2
Internal memory even address	+0	1	+0	1	+0	2
Internal memory odd address	+0	1	+2	2	+4	4
External data bus 16-bit even address	+1	1	+1	1	+2	2
External data bus 16-bit odd address	+1	1	+4	2	+8	4
External data bus 8-bit	+1	1	+4	2	+8	4

Notes: • (b), (c), (d) is used for ~ (number of cycles) and B (correction value) in instruction table.

- When the external bus is used, cycles for wait insertion for the ready input and automatic ready operation must be added.

Table 6 Correction Value for Number of Cycles for Calculating Number of Program Fetch Cycles

Instruction	Byte boundary	Word boundary
Internal memory	—	+2
External data bus 16-bit	—	+3
External data bus 8-bit	+3	—

Notes: • When the external bus is used, cycles for wait insertion for the ready input and automatic ready operation must be added.

- Because execution of instruction is not delayed for all program fetch operations, use this value to calculate the worst case.

All Rights Reserved.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document are presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION:

Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the prior authorization by Japanese government will be required for export of those products from Japan.
