CMOS

F²MC-16L MB90610A Series

MB90611A/MB90613A

■ DESCRIPTION

MB90610A series includes 16-bit microcontrollers optimally usable for high-speed real-time data processing in consumer appliances and for system control of printer, CD-ROM, cellular phone, copier, etc. The series uses the *F²MC-16L CPU which is based on the F²MC-16 but with enhanced high-level language and task switching instructions and additional addressing modes.

The internal peripheral resources consist of a 3-channel serial port incorporating a UART function (and supporting I/O expansion serial mode), 8-channel 10-bit A/D converter, 2-channel PPG, 2-channel 16-bit reload timer, 8-channel chip select output, and 8-channel external interrupts.

Also, multiplexed or non-multiplexed operation can be selected for the address/data bus.

*: "F²MC is an abbreviation for "Fujitsu Flexible Microcontroller".

■ FEATURES

- F²MC-16L CPU
- Minimum instruction execution time: 62.5 ns/4 MHz oscillation (Uses PLL clock multiplication), maximum multiplier = 4
- Instruction set optimized for controller applications
 - Upward object code compatibility with F²MC-16 (H)
 - Wide range of data types (bit/byte/word/long word)
 - Improved instruction cycles provide increased speed
 - Additional addressing modes: 23 modes
 - High code efficiency
 - Access methods (bank access/linear pointer)
 - Enhanced multiplication and division instructions (signed instructions added)
 - High precision operations are enhanced by use of a 32-bit accumulator
 - Extended intelligent I/O service (access area extended to 64 Kbytes)
 - Maximum memory space: 16 Mbytes

(Continued)

■ PACKAGE

100-pin Plastic LQFP

(FPT-100P-M05)

100-pin Plastic QFP

(FPT-100P-M06)

MB90610A Series

(Continued)

- Enhanced high level language (C)/multitasking support instructions
 - Use of a system stack pointer
 - Enhanced pointer indirect instructions
 - Barrel shift instructions
 - Stack check function
- Improved execution speed: Four byte instruction queue
- Powerful interrupt function
- Automatic data transfer function (does not use instructions)

Internal peripherals

- RAM: 1 Kbyte (MB90611A) 3 Kbytes (MB90613A)
- General purpose ports 8, 16-bit data bus, multiplexed mode : 57 ports max.
 - 16-bit non-multiplexed mode : 41 ports max.
 - 8-bit non-multiplexed mode : 49 ports max.
- UART (SCI): 3 channels
 - For either asynchronous or clocked serial transfer (I/O expansion serial)
- A/D converter: 8 channels (10-bit)
 - 8-bit conversion mode also available
- PPG (programmable pulse generator): 2 channels
- 16-bit reload timer: 2 channels
- Chip select output: 8 channels
- External interrupts: 8 channels
- 18-bit timebase timer
 - Watchdog timer function
- PLL clock multiplier function
- CPU intermittent operation function
- Various standby modes
- LQFP-100/QFP-100 package
- CMOS technology

MB90610A Series

■ PRODUCT LINEUP

Part No. Parameter	MB90611A	MB90613A
Classification	Mask ROM	
ROM size	—	
RAM size	1 Kbyte	3 Kbytes
CPU functions	Number of basic instructions : 340 Instruction bit length : 8/16 bits Instruction length : 1 to 7 bytes Data bit length : 1/4/8/16/32 bits Minimum instruction execution time : 62.5 ns/4 MHz (PLL multiplier = 4) Interrupt processing time : 1000 ns/16 MHz (minimum)	
Ports	I/O ports (CMOS/TTL) : 33 (31 CMOS/2 TTL) (N-channel open drain): 8 (16-bit non-multiplex mode) Total : 41	
Packages	FPT-100P-M05 FPT-100P-M06	
UART (SCI)	Three internal UARTs Full-duplex, double-buffered Selectable clock synchronous or asynchronous operation Built-in dedicated baud rate generator	
A/D Converter	10-bit × 8 channels A/D conversion time : 6.13 μs (98 machine cycles/16 MHz machine clock, includes sample and hold time) Triggers : Software, external, or multi-function timer output (RT0) activation can be selected. Activation modes : Single, scan (continuous conversion of multiple channels), continuous (continuous conversion of one channel), and stop (scan mode with synchronized conversion start)	
PPG	2 × 8-bit PPG outputs (1 channel PPG output in 16-bit mode)	
16-Bit Reload Timer	16-bit reload timer operation (selectable toggle output, one-shot output) (Selectable count clock: 0.125 μs, 0.5 μs, or 2.0 μs for a 16 MHz machine cycle) Selectable event count function, 2 internal channels	
Chip select	8 outputs	
External interrupts	8 inputs External interrupt mode (Interrupts can be generated from four different types of request signal)	
PLL Function	Selectable multiplier: 1/2/3/4 (Set a multiplier that does not exceed the assured operation frequency range.)	
Other	—

■ PIN DESCRIPTION

Pin no.		Pin name	Circuit type	Function
LQFP*1	QFP*2			
80 81	82 83	X0 X1	A (Oscillator)	Crystal oscillator pins
83 to 90	85 to 92	D00 to D07	K (TTL)	In non-multiplex mode, the I/O pins for the lower 8 bits of the external data bus.
		AD00 to AD07		In multiplexed mode, the I/O pins for the lower 8 bits of the external address/data bus.
91 to 98	93 to 100	P10 to P17	K (TTL)	General purpose I/O ports This applies in non-multiplexed mode with an 8-bit external data bus.
		P08 to D15		In non-multiplexed mode, the I/O pins for the upper 8 bits of the external data bus This applies when using a 16-bit external data bus.
		AD08 to AD15		In multiplexed mode, the I/O pins for the upper 8 bits of the external address/data bus.
99 100 1 to 6	1 to 8	P20 to P27	B (CMOS)	General purpose I/O ports This applies in multiplexed mode.
		A00 to A07		In non-multiplexed mode, the output pins for the lower 8 bits of the external address bus.
7 8 10 to 15	9 10 12 to 17	P30 to P37	B (CMOS)	General purpose I/O ports This applies in multiplexed mode.
		A08 to A15		In non-multiplexed mode, the output pins for the upper 8 bits of the external address bus.
16 to 20 22 to 24	18 to 22 24 to 26	P40 to P47	B (CMOS)	General purpose I/O ports This applies when the upper address control register specifies port operation.
		A16 to A23		The output pins for A16 to 23 of the external address bus This applies when the upper address control register specifies address operation.
25 to 28	27 to 30	P70 to P73	H (CMOS/ H)	General purpose I/O ports This applies in all cases.
		INT0 to INT3		External interrupt request input pins As the inputs operate continuously when external interrupts are enabled, output to the pins from other functions must be stopped unless done intentionally.

MB90610A Series

Pin no.		Pin name	Circuit type	Function
LQFP*1	QFP*2			
29 30	31 32	P74, P75	H (CMOS/H)	General purpose I/O ports This applies when the waveform outputs for PPG timers 0 to 1 are disabled.
		INT4, INT5		External interrupt request input pins As the inputs operate continuously when external interrupts are enabled, output to the pins from other functions must be stopped unless done intentionally.
		PPG0, PPG1		Output pins for PPG timers 0 to 1 This applies when the waveform outputs for PPG timers 0 to 1 are enabled.
31	33	P76	H (CMOS/H)	General purpose I/O port This applies in all cases.
		INT6		External interrupt request input pin As the input operates continuously when the external interrupt is enabled, output to the pin from other functions must be stopped unless done intentionally.
		$\overline{\text{ATG}}$		Trigger input pin for the A/D converter As the input operates continuously when the A/D converter inputs are operating, output to the pin from other functions must be stopped unless done intentionally.
32	34	AV _{cc}	Power supply	Power supply for the analog circuits Do not switch this power supply on/off unless a voltage greater than AV _{cc} is applied to V _{cc} .
33	35	AVRH	Power supply	Analog circuit reference voltage input Do not switch the voltage to this pin on/off unless a voltage greater than AVRH is applied to AV _{cc} .
34	36	AVRL	Power supply	Analog circuit reference voltage input
35	37	AV _{ss}	Power supply	Ground level for the analog circuits
36 to 39 41 to 44	38 to 41 43 to 46	P60 to P67	C (AD)	Open-drain output ports This applies when port operation is specified in the analog input enable register.
		AN0 to AN7		Analog input pins for the A/D converter This applies when analog input mode operation is specified in the analog input enable register.
45	47	P80	H (CMOS/H)	General purpose I/O port This applies in all cases.
		INT7		External interrupt request input pin As the input operates continuously when the external interrupt is enabled, output to the pin from other functions must be stopped unless done intentionally.
		TIN0		Event input pin for reload timer 0 As the input operates continuously when the reload timer is set to input operation, output to the pin from other functions must be stopped unless done intentionally.

MB90610A Series

Pin no.		Pin name	Circuit type	Function
LQFP*1	QFP*2			
46	48	P81	D (CMOS/ H)	General purpose I/O port This applies in all cases.
		TIN1		Event input pin for reload timer 1 As the input operates continuously when the reload timer is set to input operation, output to the pin from other functions must be stopped unless done intentionally.
47, 48	49, 50	MD0, MD1	E (CMOS/ H)	Input pins for specifying an operating mode Connect directly to V _{CC} or V _{SS} .
49	51	MD2	M (CMOS/ H)	Input pins for specifying an operating mode Connect directly to V _{CC} or V _{SS} .
50	52	HST $\bar{}$	F (CMOS/ H)	Hardware standby input pin
51, 52	53, 54	P82, P83	D (CMOS/ H)	General purpose I/O ports This applies when output is disabled for reload timers 0 to 1.
		TOT0, TOT1		Output pins for reload timers 0 to 1 This applies when output is enabled for reload timers 0 to 1.
53	55	P84	D (CMOS/ H)	General purpose I/O port This applies in all cases.
		SIN0		Serial data input pin for UART0 As the input operates continuously when UART0 is set to input operation, output to the pin from other functions must be stopped unless done intentionally.
54	56	P85	D (CMOS/ H)	General purpose I/O port This applies when serial data output is disabled for UART0.
		SOT0		Serial data output pin for UART0 This applies when serial data output is enabled for UART0.
55	57	P86	D (CMOS/ H)	General purpose I/O port This applies when the UART0 clock output is disabled.
		SCK0		Clock I/O pin for UART0 This applies when the UART0 clock output is enabled. As the input operates continuously when UART0 is set to input operation, output to the pin from other functions must be stopped unless done intentionally.
56	58	P90	D (CMOS/ H)	General purpose I/O port This applies in all cases.
		SIN1		Serial data input pin for UART1 As the input operates continuously when UART1 is set to input operation, output to the pin from other functions must be stopped unless done intentionally.

Pin no.		Pin name	Circuit type	Function
LQFP*1	QFP*2			
57	59	P91	D (CMOS/H)	General purpose I/O port This applies when serial data output is disabled for UART1.
		SOT1		Serial data output pin for UART1 This applies when serial data output is enabled for UART1.
58	60	P92	D (CMOS/H)	General purpose I/O port This applies when the UART1 clock output is disabled.
		SCK1		Clock I/O pin for UART1 This applies when the UART1 clock output is enabled. As the input operates continuously when UART1 is set to input operation, output to the pin from other functions must be stopped unless done intentionally.
59	61	P93	D (CMOS/H)	General purpose I/O port This applies in all cases.
		SIN2		Serial data input pin for UART2 As the input operates continuously when UART2 is set to input operation, output to the pin from other functions must be stopped unless done intentionally.
60	62	P94	D (CMOS/H)	General purpose I/O port This applies when serial data output is disabled for UART2.
		SOT2		Serial data output pin for UART2 This applies when serial data output is enabled for UART2.
61	63	P95	D (CMOS/H)	General purpose I/O port This applies when the UART2 clock output is disabled.
		SCK2		Clock I/O pin for UART2 This applies when the UART2 clock output is enabled. As the input operates continuously when UART2 is set to input operation, output to the pin from other functions must be stopped unless done intentionally.
62	64	CS0	J (CMOS)	Chip select pin for program ROM
63 to 69	65 to 71	PA1 to PA7	I (CMOS)	General purpose I/O ports This applies for pins with chip select output disabled by the chip select control register.
		CS1 to CS7		Output pins for the chip select function This applies for pins with chip select output enabled by the chip select control register.
70	72	P50	I (CMOS)	General purpose I/O port This applies when CLK output is enabled.
		CLK		CLK output pin

■ HANDLING DEVICES

1. Preventing Latchup

Latchup occurs in a CMOS IC if a voltage greater than V_{CC} or less than V_{SS} is applied to an input or output pin or if the voltage applied between V_{CC} and V_{SS} exceeds the rating.

If latchup occurs, the power supply current increases rapidly resulting in thermal damage to circuit elements. Therefore, ensure that maximum ratings are not exceeded in circuit operation.

For the same reason, also ensure that the analog supply voltage does not exceed the digital supply voltage.

2. Treatment of Unused Pins

Leaving unused input pins unconnected can cause misoperation. Always pull-up or pull-down unused pins.

3. External Reset Input

To reliably reset the controller by inputting an “L” level to the \overline{RST} pin, ensure that the “L” level is applied for at least five machine cycles. Take particular note when using an external clock input.

4. V_{CC} and V_{SS} Pins

Ensure that all V_{CC} pins are at the same voltage. The same applies for the V_{SS} pins.

5. Cautions When Using an External Clock

Drive the X0 pin only when using an external clock.

• Using an External Clock

6. A/D Converter Power Supply and the Turn-on Sequence for Analog Inputs

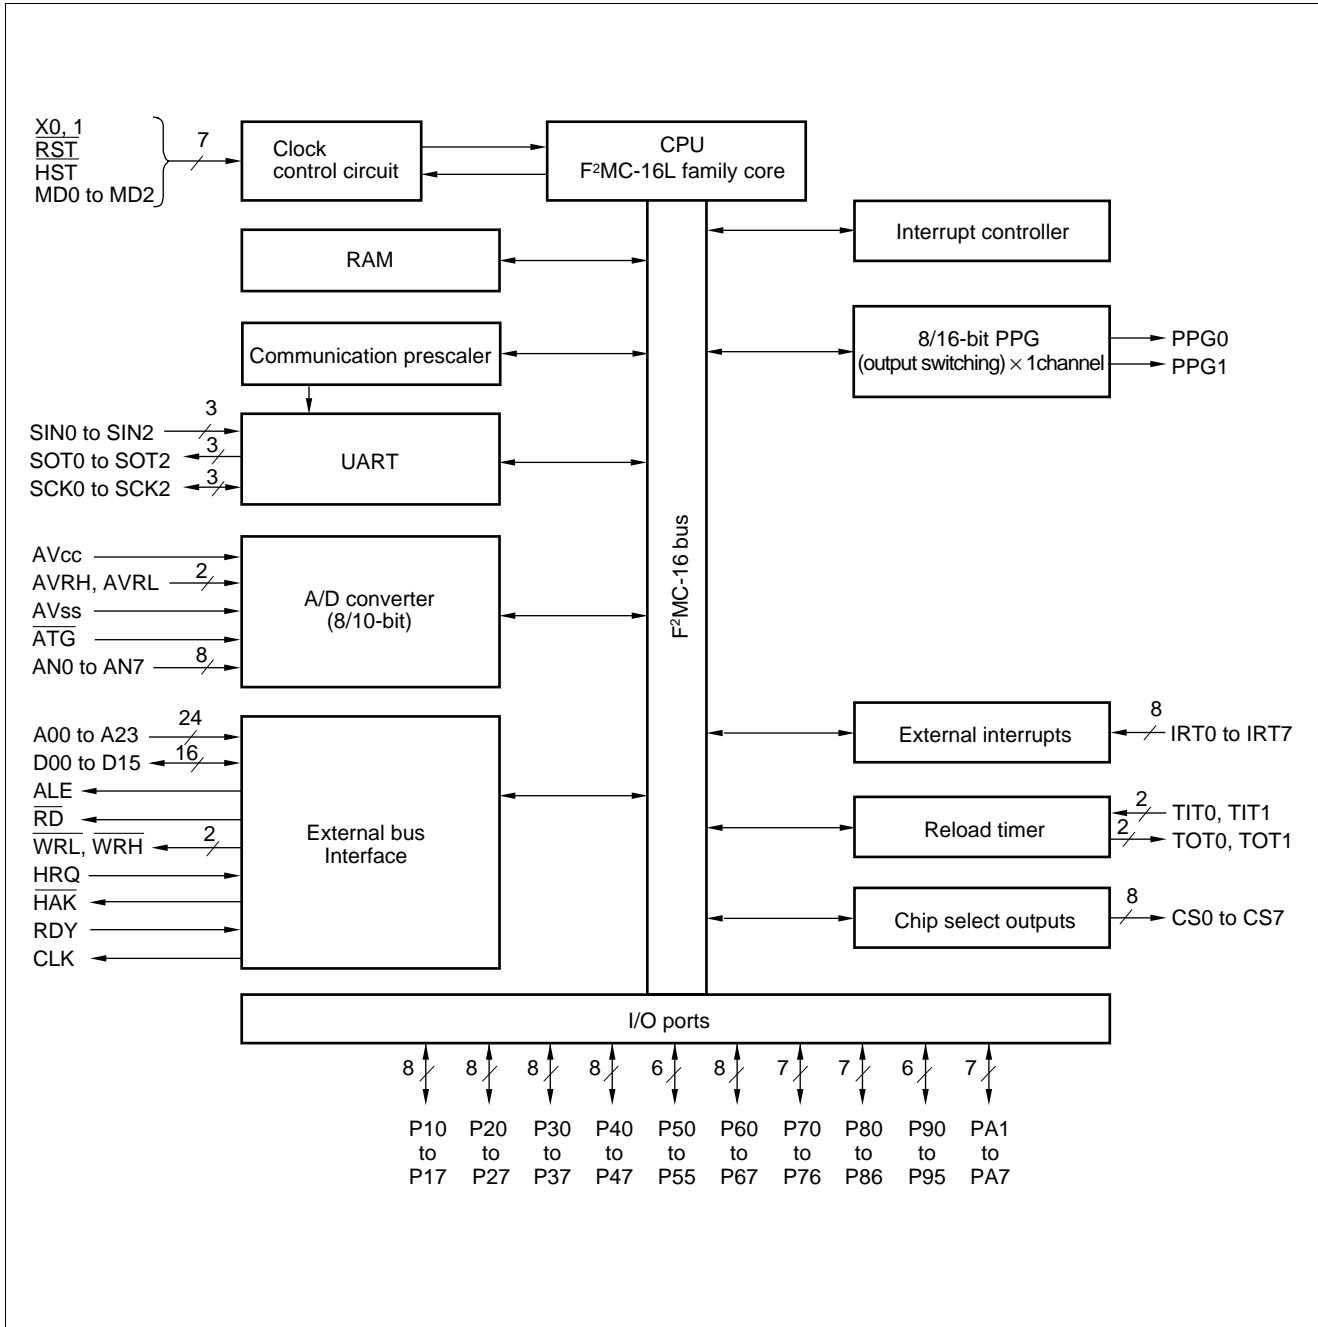

Always cut the A/D converter power supply (AV_{CC} , AV_{RH} , AV_{RL}) and analog inputs (AN0 to AN7) before disconnecting the digital power supply (V_{CC}).

When turning the power on or off, ensure that AV_{RH} does not exceed AV_{CC} .

Also, when using the analog input pins as input ports, ensure that the input voltage does not exceed AV_{CC} .

Initial values

- 0 : The initial value for this bit is "0".
- 1 : The initial value for this bit is "1".
- * : The initial value for this bit is "1" or "0". (Determined by the level of the MD0 to MD2 pins.)
- X : The initial value for this bit is undefined.
- : This bit is not used. The initial value is undefined.

*1: Access prohibited.

*2: This is the only external access area in the area below address 0000FF_H. Access this address as an external I/O area.

*3: Areas marked as "free" in the I/O map are reserved areas. These areas are accessed by internal access. No access signals are output on the external bus.

*4: Only bit 15 can be written. The other bits are written to by the test function. Reading bits 10 to 15 returns zeros.

*5: The R/W! symbol in the Read/Write column indicates that some bits are read-only or write-only. See the resource's register list for details.

6: Using a read-modify-write instruction (such as the bit set instruction) to access one of the registers indicated by R/W!, R/W, or W in the Read/Write column sets the specified bit to the desired value. However, this can cause misoperation if the other register bits include write-only bits. Therefore, do not use read-modify-write instructions to access these registers.

*7: This register is only available when the address/data bus is in multiplex mode. Access to the register is prohibited in non-multiplex mode.

*8: This register is only available when the external data bus is in 8-bit mode. Access to the register is prohibited in 16-bit mode.

Note: The initial values listed for write-only bits are the initial values set by a reset. They are not the values returned by a read.

Also, LPMCR/CKSCR/WDTIC are sometimes initialized and sometimes not initialized, depending on the reset type. The listed initial values are for when these registers are initialized.

MB90610A Series

■ PERIPHERAL RESOURCES

1. Parallel Port

The MB90610A series has 58 I/O pins, 18 output pins, and 8 open drain output pins.

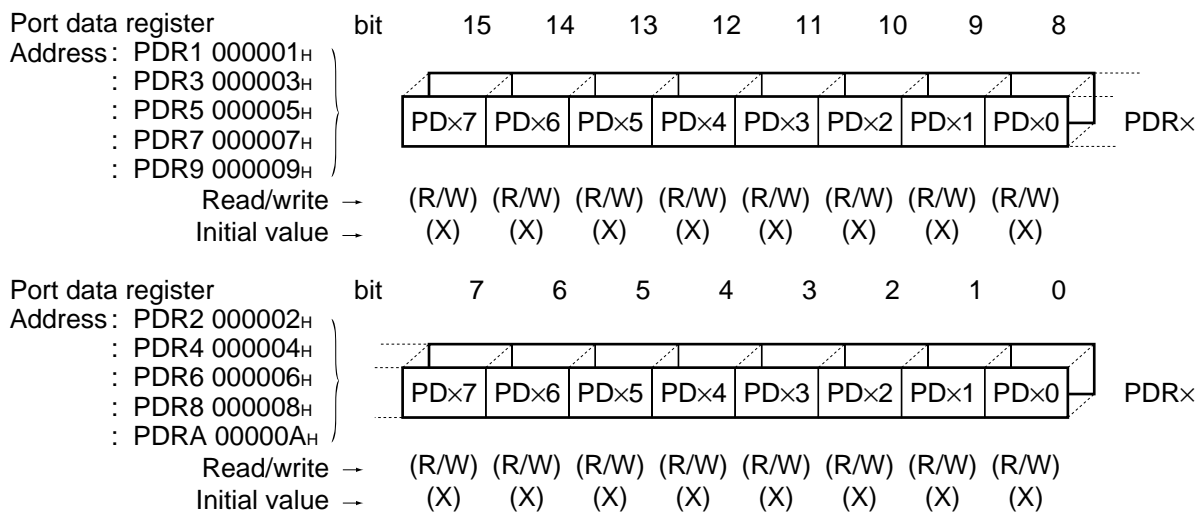

Ports 1 to 5 and ports 7 to A are I/O ports. The ports are inputs when the corresponding direction register bit is "0" and outputs when the corresponding bit is "1".

Port 1 is only available when the external data bus is in 8-bit mode. Access is prohibited in 16-bit mode.

Ports 2 and 3 are only available when the address/data bus is in multiplex mode. Access is prohibited in non-multiplex mode.

Port 6 is an open drain port. Port 6 pins can only be used as ports when the analog input enable register is "0".

(1) Register Configuration

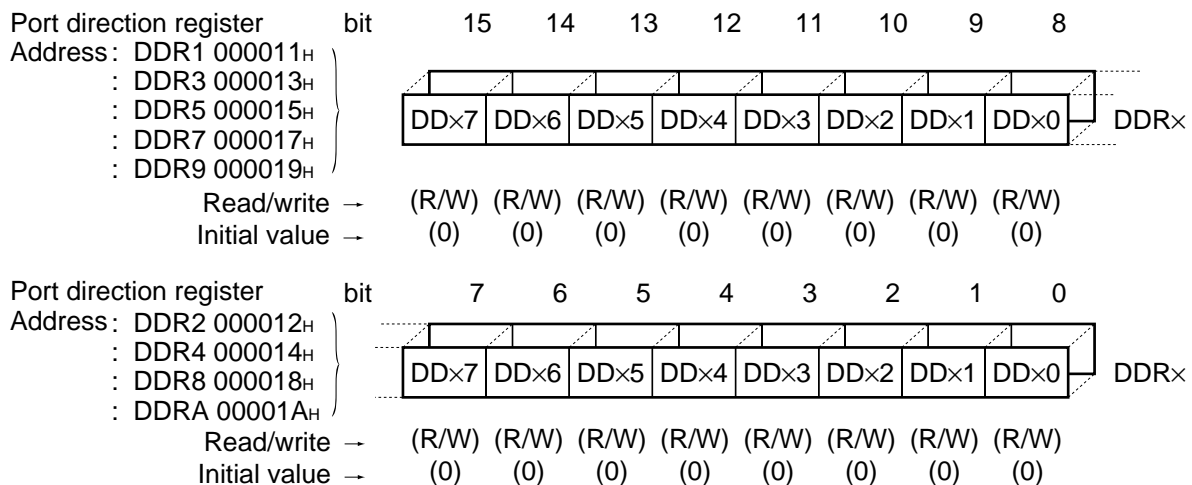

Notes: No register bits are provided for bit 6 to 7 of port 5.

No register bit is provided for bit 7 of port 7.

No register bit is provided for bit 7 of port 8.

No register bits are provided for bits 6 to 7 of port 9.

No register bit is provided for bit 0 of port A.

MB90610A Series

Note: No register bits are provided for bit 6 to 7 of port 5.
 No register bit is provided for bit 7 of port 7.
 No register bit is provided for bit 7 of port 8.
 No register bits are provided for bits 6 to 7 of port 9.
 No register bit is provided for bit 0 of port A.
 Port 6 does not have a DDR.

When pins are used as ports, the register bits control the corresponding pins as follows.

- 0: Input mode
- 1: Output mode

Bits are set to "0" by a reset.

Note: No register bits are provided for bit 6 to 7 of port 5.

No register bit is provided for bit 7 of port 7.

No register bit is provided for bit 7 of port 8.

No register bit is provided for bit 0 of port A.

No register bits are provided for bits 6 to 7 of port 9.

Port 6 does not have a DDR.

Port 1 is only available when the external data bus is in 8-bit mode. Access is prohibited in 16-bit mode.

Ports 2 and 3 are only available in multiplex mode. Access is prohibited in non-multiplex mode.

• Analog Input Enable Register

	bit	15	14	13	12	11	10	9	8	
Analog input enable register	}									ADER
ADER 000016H										
Read/write	→	(R/W)	(R/W)	(R/W)	(R/W)	(R/W)	(R/W)	(R/W)	(R/W)	
Initial value	→	(1)	(1)	(1)	(1)	(1)	(1)	(1)	(1)	

Controls each pin of port 6 as follows.

- 0: Port input mode
- 1: Analog input mode

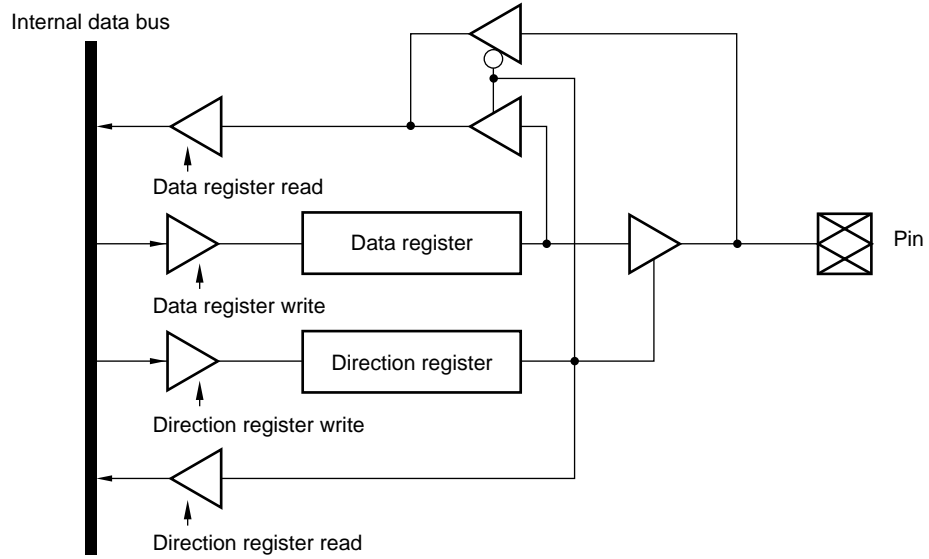

Bits are set to "1" by a reset.

Note: Inputting an intermediate level signal in port input mode causes an input leak current to flow. Therefore, set to analog input mode when applying an analog input.

P51/RDY	RDY				RDY			
P50/CLK	CLK				CLK			

Note: The upper address, \overline{WRL} , \overline{WRH} , \overline{HAK} , HRQ, RDY, and CLK can be set for use as ports by function selection.

MB90610A Series

2. UART 0/1/2 (SCI)

UART 0/1/2 are serial I/O ports that can be used for CLK asynchronous (start-stop synchronization) or CLK synchronous (I/O expansion serial) data transfer. The ports have the following features.

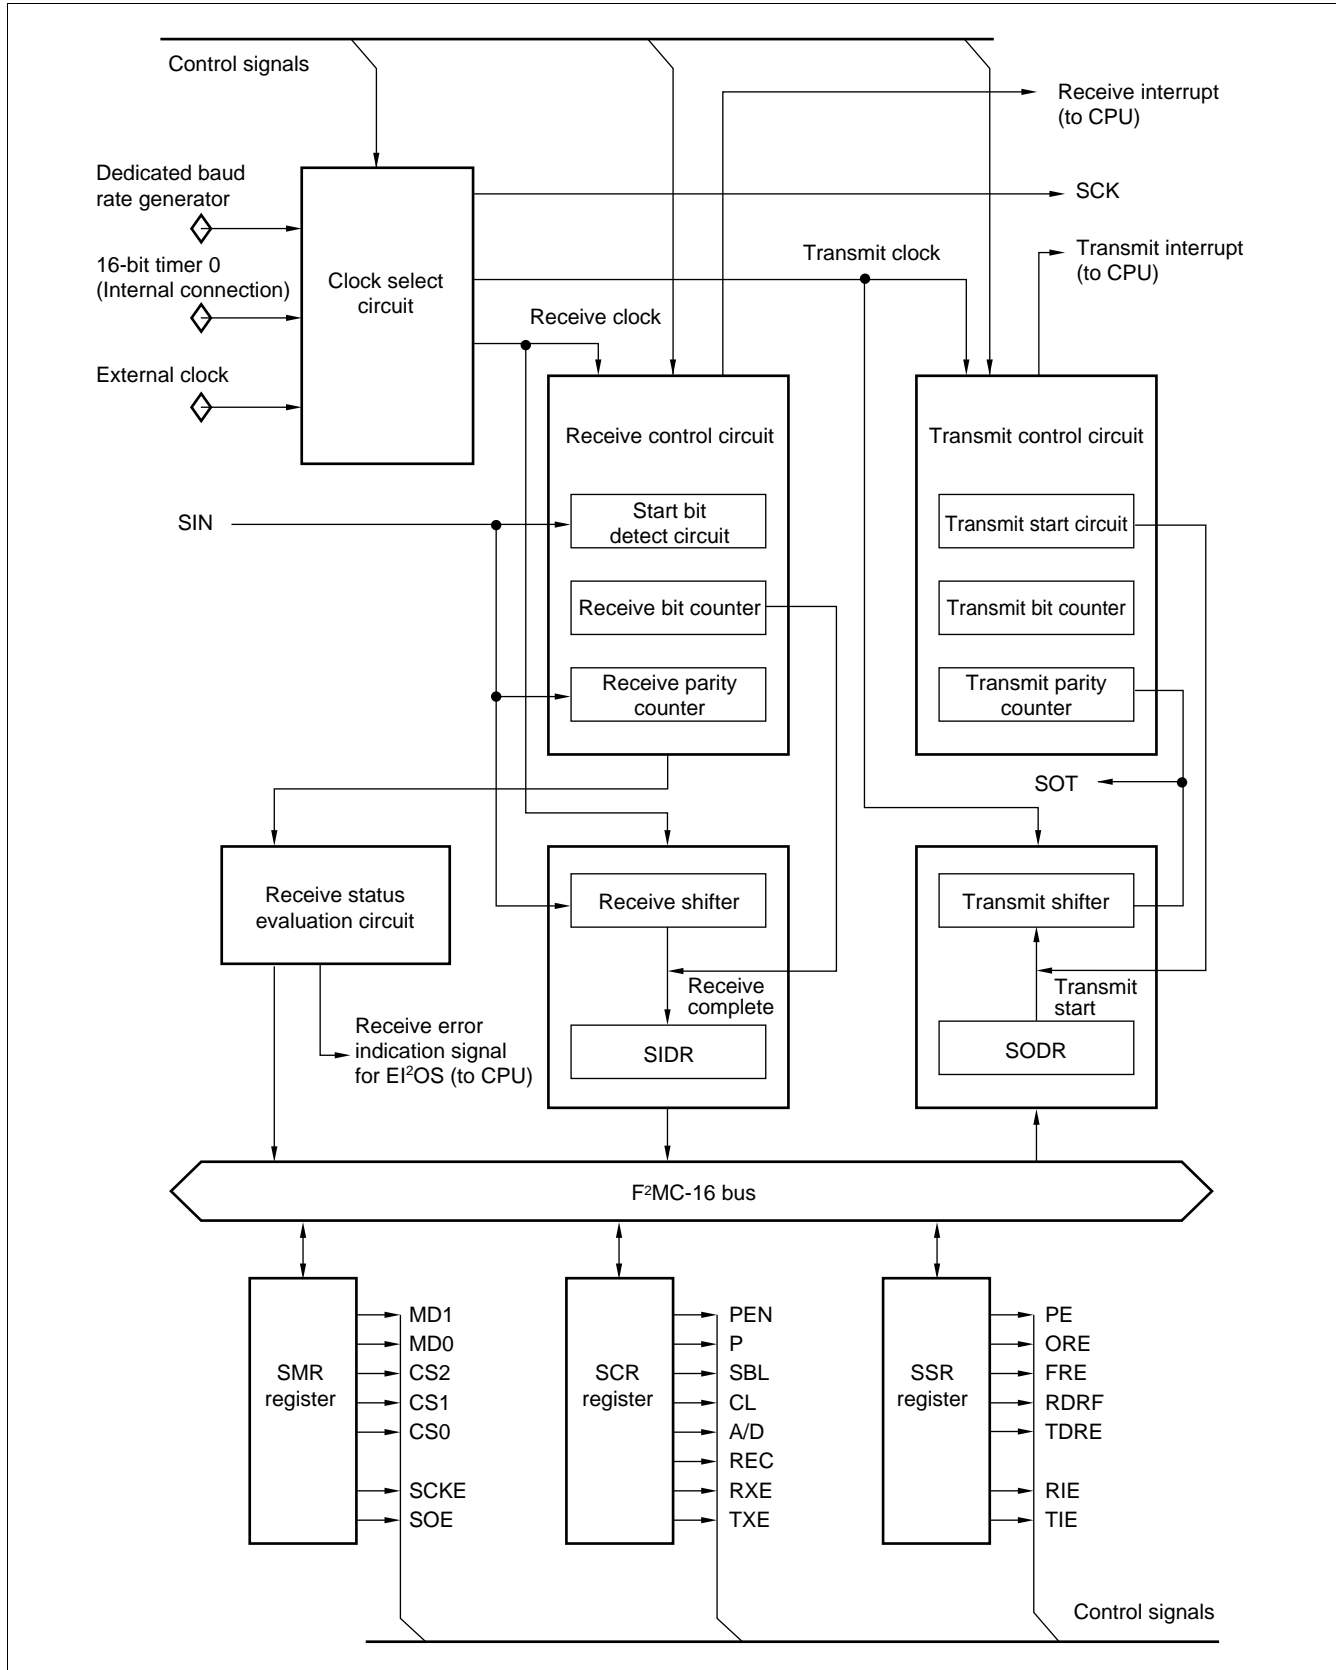

- Full duplex, double buffered
- Supports CLK asynchronous (start-stop synchronization) and CLK synchronous (I/O expansion serial) data transfer
- Multi-processor mode support
- Built-in dedicated baud rate generator
 - CLK asynchronous: 62500/31250/19230/9615/4808/2404/1202 bps
 - CLK synchronous: 2 M/1 M/500 K/250 K bps
- Supports flexible baud rate setting using an external clock
- Error detect function (parity, framing, and overrun)
- NRZ type transmission signal
- Intelligent I/O service support

3. 10-bit 8-input A/D Converter (With 8-bit Resolution Mode)

The 10-bit 8-input A/D converter converts analog input voltages to digital values. The A/D converter has the following features.

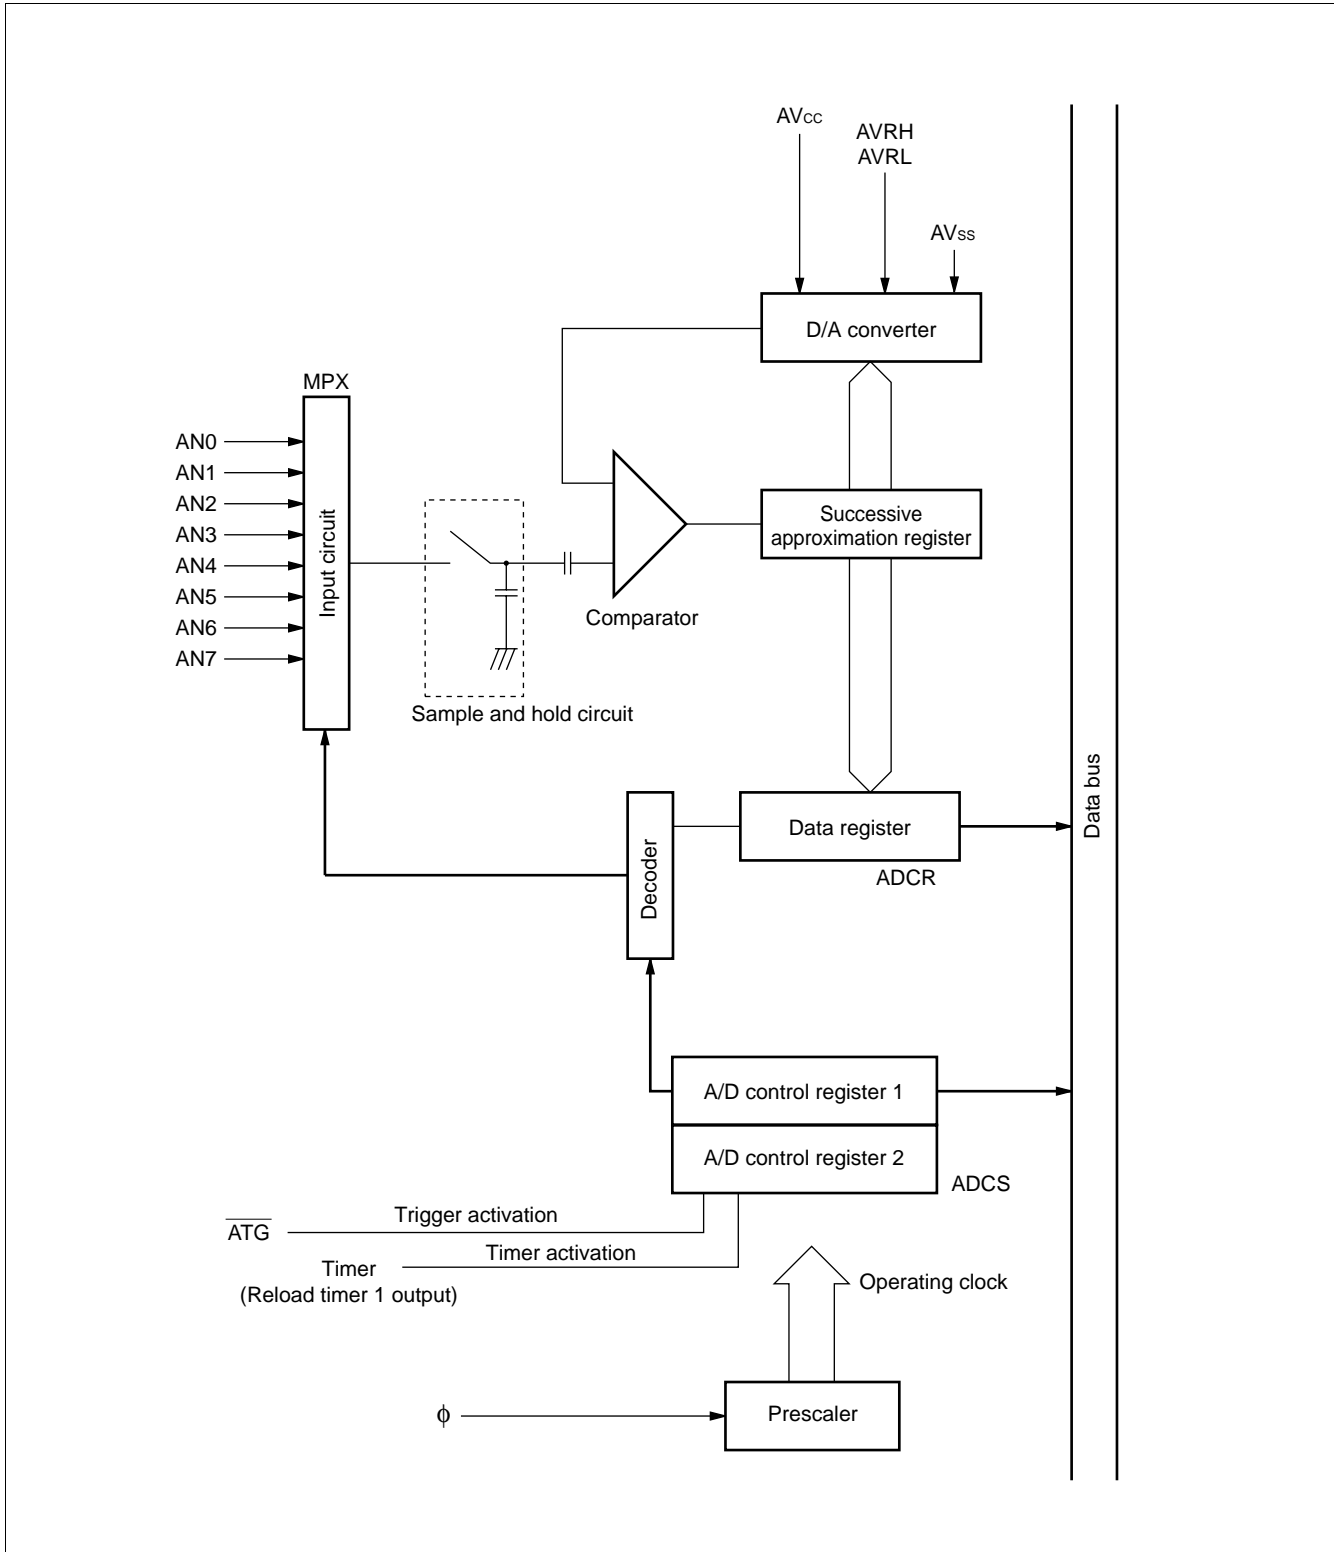

- Conversion time: Minimum of 6.13 μ s per channel (98 machine cycles/16 MHz machine clock. This includes the sample and hold time)
- Sample and hold time: Minimum of 3.75 μ s per channel (60 machine cycles/16 MHz machine clock)
- Uses RC-type successive approximation conversion with a sample and hold circuit.
- 10-bit or 8-bit resolution
- Eight program-selectable analog input channels
 - Single conversion mode : Selectively convert a one channel.
 - Scan conversion mode : Continuously convert multiple channels. Maximum of 8 program-selectable channels.
 - Continuous conversion mode : Repeatedly convert specified channels.
 - Stop conversion mode : Convert one channel then halt until the next activation. (Enables synchronization of the conversion start timing.)
- An A/D conversion completion interrupt request to the CPU can be generated on the completion of A/D conversion. This interrupt can activate I²OS to transfer the result of A/D conversion to memory and is suitable for continuous operation.
- Activation by software, external trigger (falling edge), or timer (rising edge) can be selected.

4. 8/16-bit PPG

This block contains the 8-bit reload timer module. The block performs PPG output in which the pulse output is controlled by the operation of the timer.

The hardware consists of two 8-bit down-counters, four 8-bit reload registers, one 16-bit control register, two external pulse output pins, and two interrupt outputs. The PPG has the following functions.

- 8-bit PPG output in 2-channel independent operation mode: Two independent PPG output channels are available.
- 16-bit PPG output operation mode : One 16-bit PPG output channel is available.
- 8+8-bit PPG output operation mode : Variable-period 8-bit PPG output operation is available by using the output of channel 0 as the clock input to channel 1.
- PPG output operation: Outputs pulse waveforms with variable period and duty ratio.
Can be used as a D/A converter in conjunction with an external circuit.

5. 16-bit Reload Timer (with Event Count Function)

The 16-bit reload timers consists of a 16-bit down-counter, a 16-bit reload register, one input (TIN) and one output (TOT) pin, and a control register. The input clock can be selected from one external clock and three types of internal clock. The output pin (TOT) outputs a toggle waveform in reload mode and a rectangular waveform during counting in one-shot mode. The input pin (TIN) functions as the event input in event count mode and as the trigger input or gate input in internal clock mode.

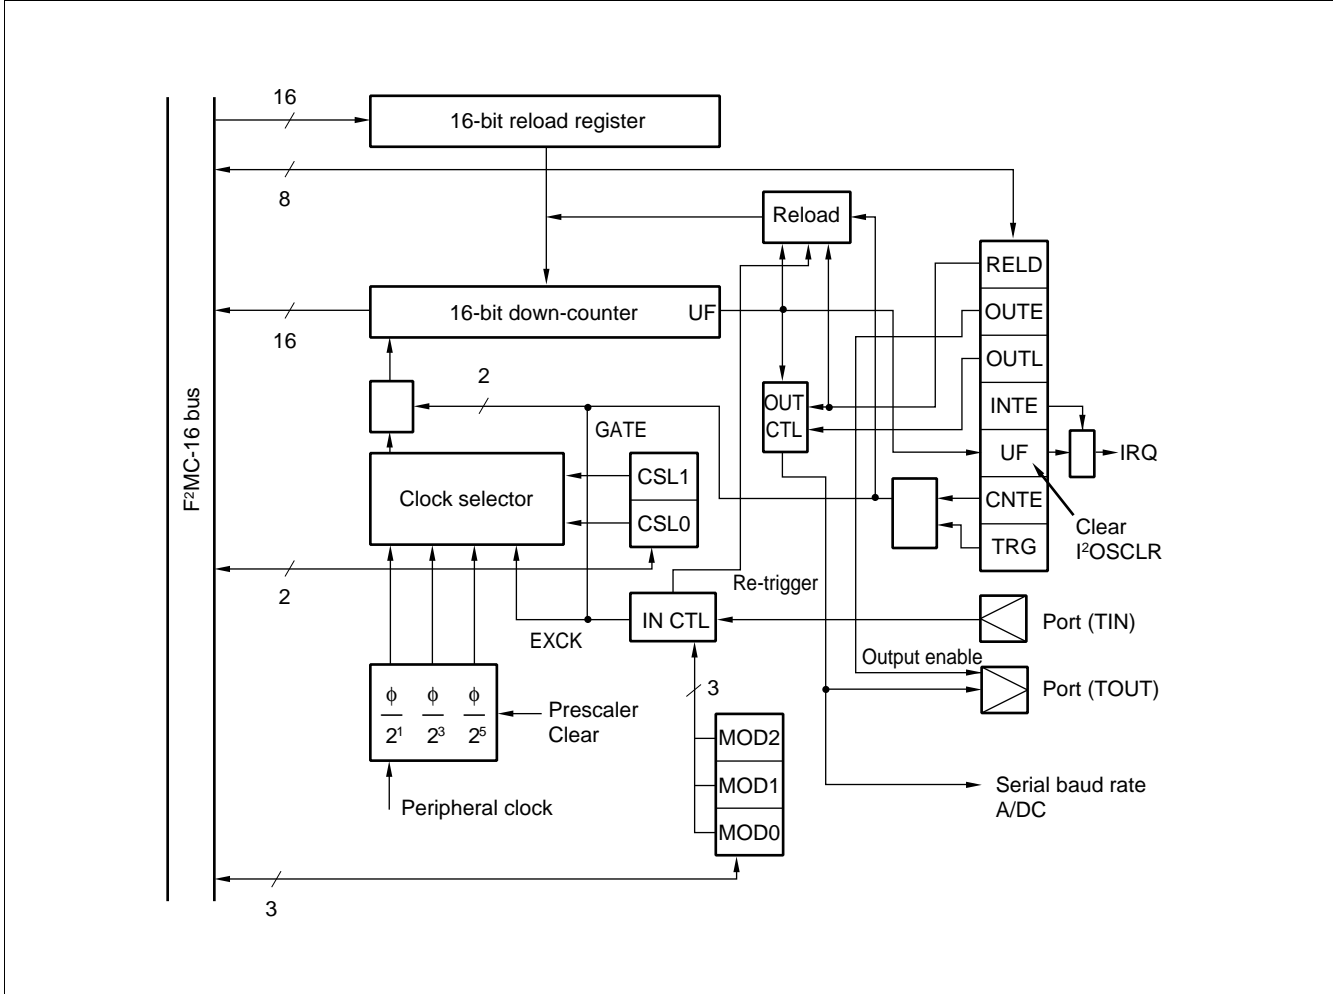

This product has two internal 16-bit reload timer channels.

6. Chip Select Function

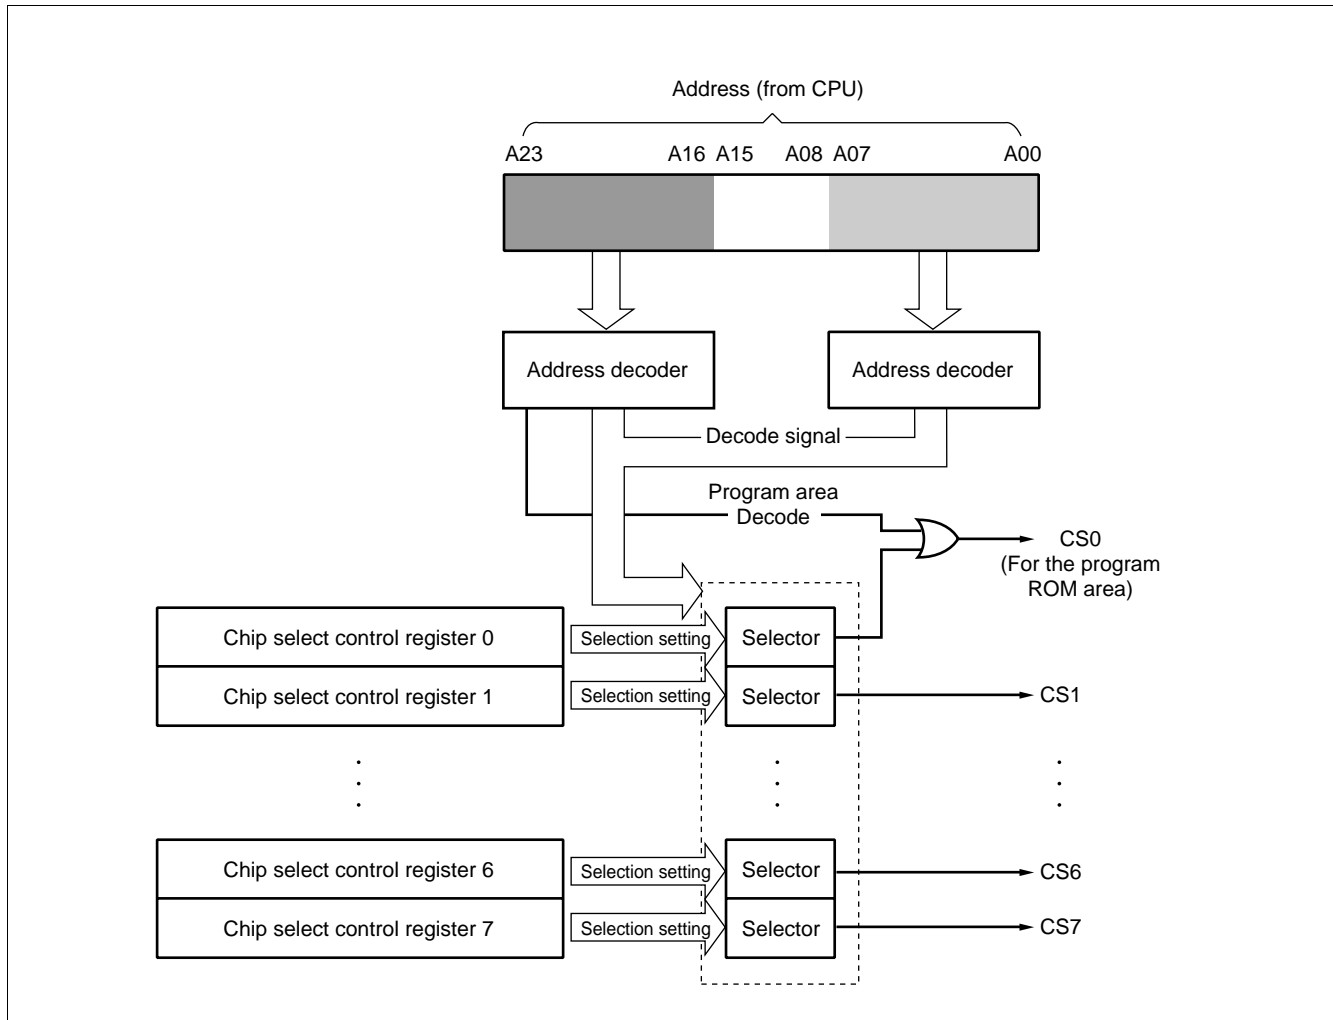

This module generates chip select signals to simplify connection of memory or I/O devices. The module has 8 chip select output pins. The hardware outputs the chip select signals from the pins when it detects access of an address in the areas specified in the pin registers.

7. DTP/External Interrupts

The DTP (Data Transfer Peripheral) is a peripheral block that interfaces external peripherals to the F²MC-16L CPU. The DTP receives DMA and interrupt processing requests from external peripherals and passes the requests to the F²MC-16L CPU to activate the extended intelligent I/O service or interrupt processing. Two request levels ("H" and "L") are provided for extended intelligent I/O service. For external interrupt requests, generation of interrupts on a rising or falling edge as well as on "H", "L" levels can be selected, giving a total of four types.

(1) Register Configuration

9. Watchdog Timer and Timebase Timer Functions

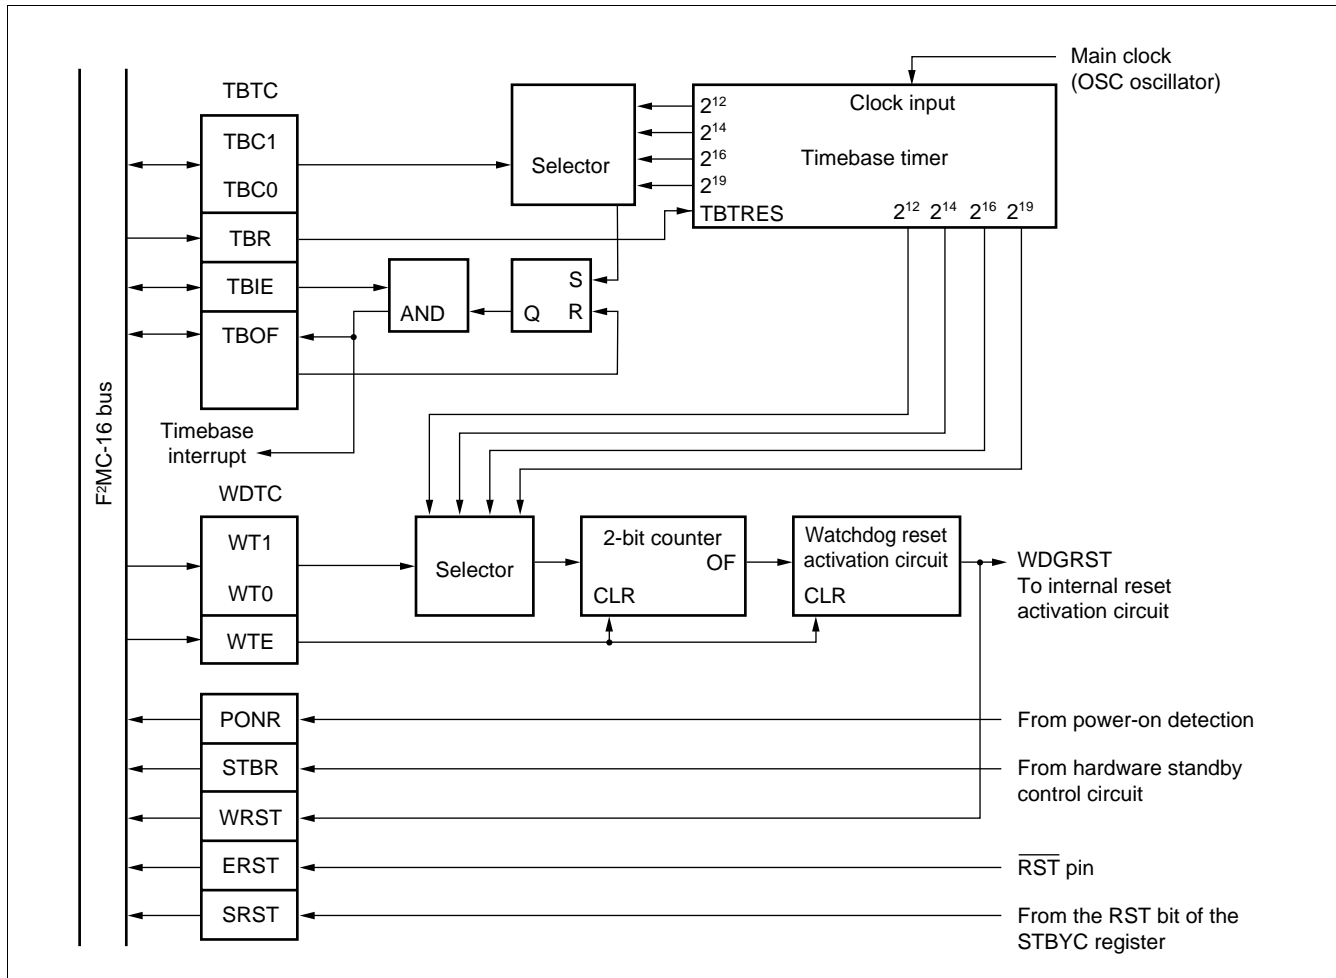

The watchdog timer consists of a 2-bit watchdog counter, a control register, and a watchdog reset controller. The watchdog counter uses the carry-up signal from the 18-bit timebase timer as its clock source. In addition to the 18-bit timer, the timebase timer contains an interval interrupt control circuit. The timebase timer uses the main clock, regardless of the value of the MCS bit in the CKSCR register.

10. Low Power Control Circuits (CPU Intermittent Operation Function, Oscillation Stabilization Delay Time, and Clock Multiplier Function)

The following operation modes are available: PLL clock mode, PLL sleep mode, timer mode, main clock mode, main sleep mode, stop mode, and hardware standby mode. Operation modes other than PLL clock mode are classified as low power consumption modes.

In main clock mode and main sleep mode, the device operates on the main clock only (OSC oscillator clock). The PLL clock (VCO oscillator clock) is stopped in these modes and the main clock divided by 2 is used as the operating clock.

In PLL sleep mode and main sleep mode, the CPU's operating clock only is stopped and other elements continue to operate.

In timer mode, only the timebase timer operates.

Stop mode and hardware standby mode stop the oscillator. These modes maintain existing data with minimum power consumption.

The CPU intermittent operation function provides an intermittent clock to the CPU when register, internal memory, internal resource, or external bus access is performed. This function reduces power consumption by lowering the CPU execution speed while still providing a high-speed clock to internal resources.

The PLL clock multiplier ratio can be set to 1, 2, 3, 4 by the CS1, 0 bits.

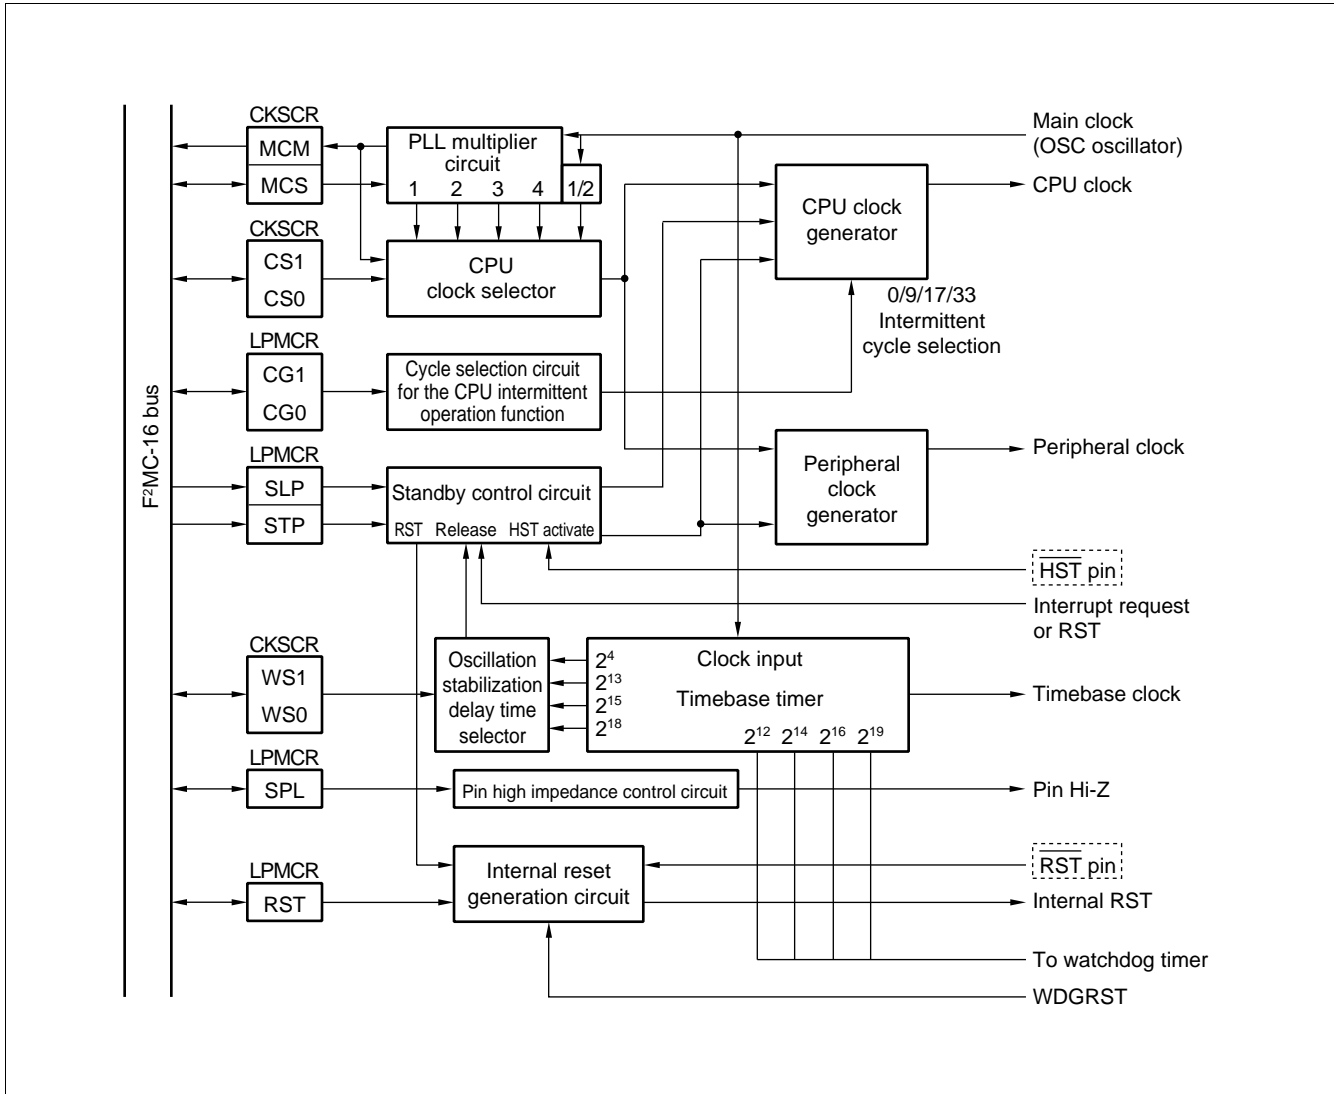

The WS1, 0 bits set the delay time to wait for the main clock oscillation to stabilize when recovering from stop mode or hardware standby mode.

11. Interrupt Controller

The interrupt control registers are located in the interrupt controller. An interrupt control register is provided for each I/O with an interrupt function. The registers have the following three functions.

- Set the interrupt level of the corresponding peripheral.
- Select whether to treat interrupts from the corresponding peripheral as standard interrupts or activate the extended intelligent I/O service.
- Select the extended intelligent I/O service channel.

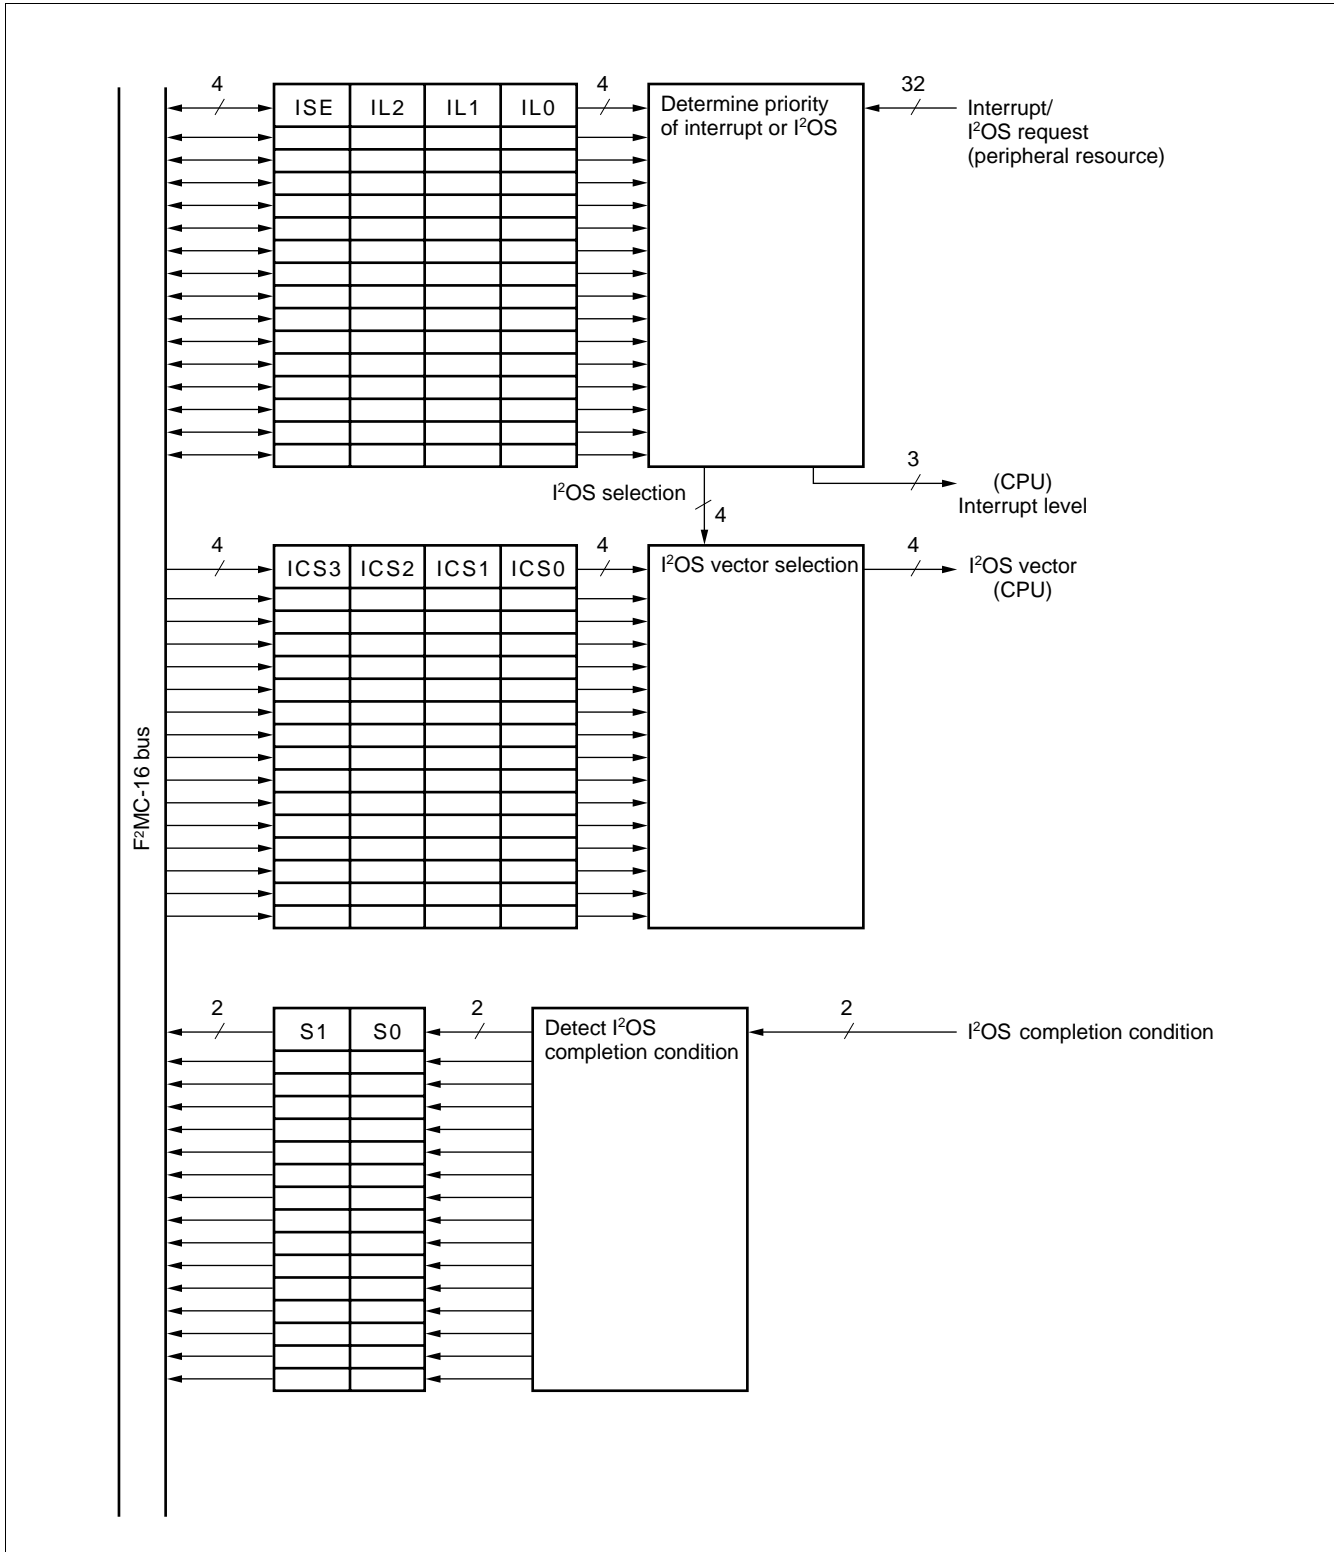

(1) Register Configuration

Note: Do not access these registers using read-modify-write instructions as this can cause misoperation.

■ ELECTRICAL CHARACTERISTICS

1. Absolute Maximum Rating

($V_{SS} = AV_{SS} = 0.0\text{ V}$)

Parameter	Symbol	Rating		Unit	Remarks
		Min.	Max.		
Power supply voltage	V_{CC}	$V_{SS} - 0.3$	$V_{SS} + 7.0$	V	
	AV_{CC}^{*1}	$V_{SS} - 0.3$	$V_{SS} + 7.0$	V	
	$AVRH^{*1}$ $AVRL^{*1}$	$V_{SS} - 0.3$	$V_{SS} + 7.0$	V	
Input voltage ^{*2}	V_I	$V_{SS} - 0.3$	$V_{CC} + 0.3$	V	
Output voltage ^{*2}	V_O	$V_{SS} - 0.3$	$V_{CC} + 0.3$	V	
"L" level maximum output current ^{*3}	I_{OL}	—	15	mA	
"L" level average output current ^{*4}	I_{OLAV}	—	4	mA	
"L" level total maximum output current	$2I_{OL}$	—	100	mA	
"L" level total average output current ^{*5}	$2I_{OLAV}$	—	50	mA	
"H" level maximum output current ^{*3}	I_{OH}	—	-15	mA	
"H" level average output current ^{*4}	I_{OHAV}	—	-4	mA	
"H" level total maximum output current	$2I_{OH}$	—	-100	mA	
"H" level total average output current ^{*5}	$2I_{OHAV}$	—	-50	mA	
Power consumption	P_d	—	+400	mW	
Operating temperature	T_A	-40	+85	°C	
Storage temperature	T_{stg}	-55	+150	°C	

*1: AV_{CC} , $AVRH$, and $AVRL$ must not exceed V_{CC} . Similarly, it may not exceed $AVRL$, nor $AVRH$.

*2: V_I and V_O must not exceed $V_{CC} + 0.3\text{ V}$.

*3: The maximum output current must not be exceeded at any individual pin.

*4: The average output current is the rating for the current from an individual pin averaged over a duration of 100 ms.

*5: The average total output current is the rating for the current from all pins averaged over a duration of 100 ms.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

MB90610A Series

2. Recommended Operating Conditions

(V_{SS} = 0.0 V)

Parameter	Symbol	Rating		Unit	Remarks
		Min.	Max.		
Power supply voltage	V _{CC}	2.7	5.5	V	For normal operation
		2.0	5.5	V	To maintain statuses in stop mode
Operating temperature	T _A	-40	+85	°C	

WARNING: Recommended operating conditions are normal operating ranges for the semiconductor device. All the device's electrical characteristics are warranted when operated within these ranges.

Always use semiconductor devices within the recommended operating conditions. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representative beforehand.

For address and data buses (AD15 to AD00),
RD and WR, $C_L = 80\text{ pF}$.

MB90610A Series

(5) Power-on Reset

(V_{CC} = +2.7 V to +5.5 V, V_{SS} = 0.0 V, T_A = -40°C to +85°C)

Parameter	Symbol	Pin name	Conditions	Value		Unit	Remarks
				Min.	Max.		
Power supply rise time	t _R	V _{CC}	—	—	30	ms	*
Power supply cut-off time	t _{OFF}	V _{CC}		1	—	ms	For repetition of the operation

* : V_{CC} should be lower than 0.2 V before power supply rise.

- Notes:
- The above values are the values required for a power-on reset
 - When $\overline{\text{HST}} = \text{"L"}$, this standard must be followed to turn on power supply for power-on reset whether or not necessary.
 - The device has built-in registers which are initialized only by power-on reset. For possible initialization of these registers, turn on power supply according to this standard.

Abrupt changes in the power supply voltage may cause a power-on reset.
When changing the power supply voltage during operation, the change should be as smooth as possible, as shown in the following figure.

Variation between channels	—	AN0 to AN7	—	—	4	LSB

*1: For $V_{CC} = +5.0\text{ V} \pm 10\%$ and a 16 MHz machine clock

*2: For $V_{CC} = +3.0\text{ V} \pm 10\%$ and a 8 MHz machine clock

*3: The current when the A/D converter is not operating or the CPU is in stop mode (for $V_{CC} = AV_{CC} = AV_{RH} = +5.0\text{ V}$).

Notes: • The relative error increases as $|AV_{RH} - AV_{RL}|$ decreases.

• The output impedance of the external circuit for the analog input should be in the following range.

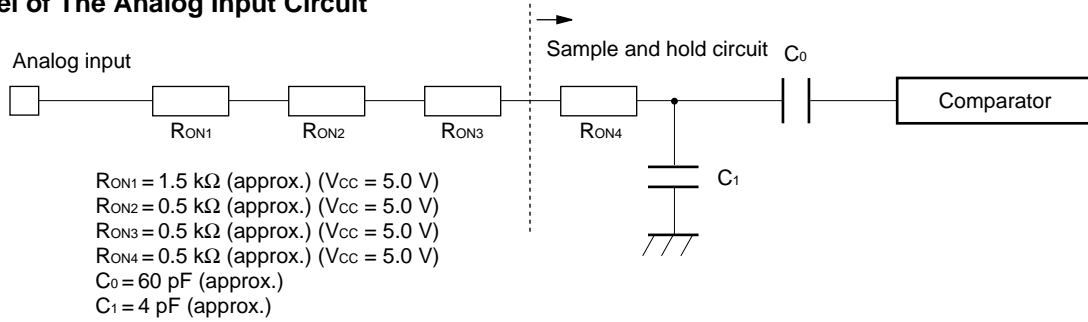

Output impedance of external circuit < approx. 7 k Ω

• If the output impedance of the external circuit is too high, the sampling time for the analog voltage may be too short. (Sampling time = 3.75 μs @ 4 MHz (This corresponds to 16 MHz internal operation if the multiplier is 4.))

• For an external capacitor to be provided outside the chip, its capacity should desirably be thousands times larger than that of the capacity in the chip taking in consideration the influence of the capacity distribution of the external and internal capacitors.

MB90610A Series

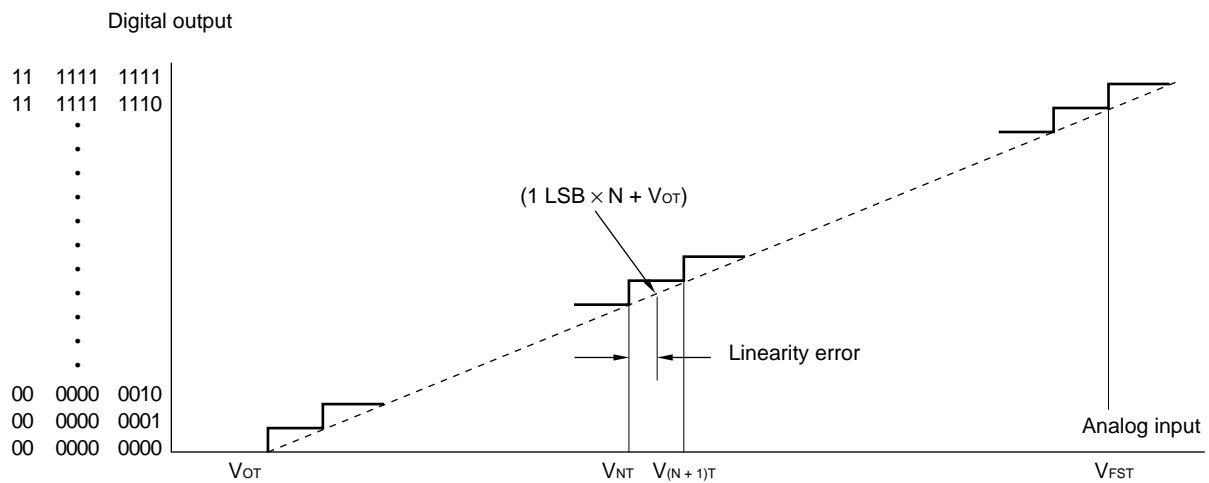

• Model of The Analog Input Circuit

Note: The above values are for reference only.

6. A/D Converter Glossary

- Resolution
The change in analog voltage that can be recognized by the A/D converter.
If the resolution is 10 bits, the analog voltage can be resolved into $2^{10} = 1024$ steps.
- Total error
The deviation between the actual and logic value attributable to offset error, gain error, non-linearity error, and noise.
- Linearity error
The deviation between the actual conversion characteristic of the device and the line linking the zero transition point (00 0000 0000 ↔ 00 0000 0001) and the full scale transition point (11 1111 1110 ↔ 11 1111 1111).
- Differential linearity error
The variation from the ideal input voltage required to change the output code by 1 LSB.

$$1 \text{ LSB} = \frac{V_{FST} - V_{OT}}{1022}$$

$$\text{Linearity error} = \frac{V_{NT} - (1 \text{ LSB} \times N + V_{OT})}{1 \text{ LSB}} \text{ (LSB)}$$

$$\text{Differential linearity error} = \frac{V_{(N+1)T} - V_{NT}}{1 \text{ LSB}} - 1 \text{ (LSB)}$$

■ INSTRUCTIONS (340 INSTRUCTIONS)

Table 1 Explanation of Items in Tables of Instructions

Item	Meaning
Mnemonic	Upper-case letters and symbols: Represented as they appear in assembler. Lower-case letters: Replaced when described in assembler. Numbers after lower-case letters: Indicate the bit width within the instruction.
#	Indicates the number of bytes.
~	Indicates the number of cycles. m : When branching n : When not branching See Table 4 for details about meanings of other letters in items.
RG	Indicates the number of accesses to the register during execution of the instruction. It is used calculate a correction value for intermittent operation of CPU.
B	Indicates the correction value for calculating the number of actual cycles during execution of the instruction. (Table 5) The number of actual cycles during execution of the instruction is the correction value summed with the value in the “~” column.
Operation	Indicates the operation of instruction.
LH	Indicates special operations involving the upper 8 bits of the lower 16 bits of the accumulator. Z : Transfers “0”. X : Extends with a sign before transferring. – : Transfers nothing.
AH	Indicates special operations involving the upper 16 bits in the accumulator. * : Transfers from AL to AH. – : No transfer. Z : Transfers 00 _H to AH. X : Transfers 00 _H or FF _H to AH by signing and extending AL.
I	Indicates the status of each of the following flags: I (interrupt enable), S (stack), T (sticky bit), N (negative), Z (zero), V (overflow), and C (carry). * : Changes due to execution of instruction. – : No change. S : Set by execution of instruction. R : Reset by execution of instruction.
S	
T	
N	
Z	
V	
C	
RMW	Indicates whether the instruction is a read-modify-write instruction. (a single instruction that reads data from memory, etc., processes the data, and then writes the result to memory.) * : Instruction is a read-modify-write instruction. – : Instruction is not a read-modify-write instruction. Note: A read-modify-write instruction cannot be used on addresses that have different meanings depending on whether they are read or written.

MB90610A Series

Table 2 Explanation of Symbols in Tables of Instructions

Symbol	Meaning
A	32-bit accumulator The bit length varies according to the instruction. Byte : Lower 8 bits of AL Word : 16 bits of AL Long : 32 bits of AL:AH
AH AL	Upper 16 bits of A Lower 16 bits of A
SP	Stack pointer (USP or SSP)
PC	Program counter
PCB	Program bank register
DTB	Data bank register
ADB	Additional data bank register
SSB	System stack bank register
USB	User stack bank register
SPB	Current stack bank register (SSB or USB)
DPR	Direct page register
brg1	DTB, ADB, SSB, USB, DPR, PCB, SPB
brg2	DTB, ADB, SSB, USB, DPR, SPB
Ri	R0, R1, R2, R3, R4, R5, R6, R7
RWi	RW0, RW1, RW2, RW3, RW4, RW5, RW6, RW7
RWj	RW0, RW1, RW2, RW3
RLi	RL0, RL1, RL2, RL3
dir	Compact direct addressing
addr16 addr24 ad24 0 to 15 ad24 16 to 23	Direct addressing Physical direct addressing Bit 0 to bit 15 of addr24 Bit 16 to bit 23 of addr24
io	I/O area (000000H to 0000FFH)
imm4 imm8 imm16 imm32 ext (imm8)	4-bit immediate data 8-bit immediate data 16-bit immediate data 32-bit immediate data 16-bit data signed and extended from 8-bit immediate data
disp8 disp16	8-bit displacement 16-bit displacement
bp	Bit offset
vct4 vct8	Vector number (0 to 15) Vector number (0 to 255)
()b	Bit address

(Continued)

MB90610A Series

1C	@RW0 + RW7			Register indirect with index	0	
1D	@RW1 + RW7			Register indirect with index	0	
1E	@PC + disp16			PC indirect with 16-bit displacement	2	
1F	addr16			Direct address	2	

Note: The number of bytes in the address extension is indicated by the “+” symbol in the “#” (number of bytes) column in the tables of instructions.

MB90610A Series

Table 4 Number of Execution Cycles for Each Type of Addressing

Code	Operand	(a)	Number of register accesses for each type of addressing
		Number of execution cycles for each type of addressing	
00 to 07	Ri RWi RLi	Listed in tables of instructions	Listed in tables of instructions
08 to 0B	@RWj	2	1
0C to 0F	@RWj +	4	2
10 to 17	@RWi + disp8	2	1
18 to 1B	@RWj + disp16	2	1
1C	@RW0 + RW7	4	2
1D	@RW1 + RW7	4	2
1E	@PC + disp16	2	0
1F	addr16	1	0

Note: “(a)” is used in the “~” (number of states) column and column B (correction value) in the tables of instructions.

Table 5 Correction Values for Number of Cycles Used to Calculate Number of Actual Cycles

Operand	(b) byte		(c) word		(d) long	
	Number of cycles	Number of access	Number of cycles	Number of access	Number of cycles	Number of access
Internal register	+0	1	+0	1	+0	2
Internal memory even address	+0	1	+0	1	+0	2
Internal memory odd address	+0	1	+2	2	+4	4
Even address on external data bus (16 bits)	+1	1	+1	1	+2	2
Odd address on external data bus (16 bits)	+1	1	+4	2	+8	4
External data bus (8 bits)	+1	1	+4	2	+8	4

Notes: • “(b)”, “(c)”, and “(d)” are used in the “~” (number of states) column and column B (correction value) in the tables of instructions.

- When the external data bus is used, it is necessary to add in the number of wait cycles used for ready input and automatic ready.

Table 6 Correction Values for Number of Cycles Used to Calculate Number of Program Fetch Cycles

Instruction	Byte boundary	Word boundary
Internal memory	—	+2
External data bus (16 bits)	—	+3
External data bus (8 bits)	+3	—

Notes: • When the external data bus is used, it is necessary to add in the number of wait cycles used for ready input and automatic ready.

- Because instruction execution is not slowed down by all program fetches in actuality, these correction values should be used for “worst case” calculations.

NCC	1	1	0	0	Prefix code for no flag change	-	-	-	-	-	-	-	-	-	-
CMR	1	1	0	0	Prefix code for common register bank	-	-	-	-	-	-	-	-	-	-

*1: PCB, ADB, SSB, USB, and SPB : 1 state
DTB, DPR : 2 states

*2: 7 + 3 ¥ (pop count) + 2 ¥ (last register number to be popped), 7 when rlst = 0 (no transfer register)

*3: 29 + (push count) - 3 ¥ (last register number to be pushed), 8 when rlst = 0 (no transfer register)

*4: Pop count ¥ (c), or push count ¥ (c)

*1: Pop count or push count.

Note: For an explanation of “(a)” to “(d)”, refer to Table 4, “Number of Execution Cycles for Each Type of Addressing,” and Table 5, “Correction Values for Number of Cycles Used to Calculate Number of Actual Cycles.”

Table 23 String Instructions [10 Instructions]

Mnemonic	#	~	RG	B	Operation	LH	AH	I	S	T	N	Z	V	C	RMW
MOVS/MOVS	2	*2	*5	*3	Byte transfer @AH+ \leftarrow @AL+, counter = RW0	–	–	–	–	–	–	–	–	–	–
MOVSD	2	*2	*5	*3	Byte transfer @AH– \leftarrow @AL–, counter = RW0	–	–	–	–	–	–	–	–	–	–
SCEQ/SCEQI	2	*1	*5	*4	Byte retrieval (@AH+) – AL, counter = RW0	–	–	–	–	–	*	*	*	*	–
SCEQD	2	*1	*5	*4	Byte retrieval (@AH–) – AL, counter = RW0	–	–	–	–	–	*	*	*	*	–
FISL/FILSI	2	6m+6	*5	*3	Byte filling @AH+ \leftarrow AL, counter = RW0	–	–	–	–	–	*	*	–	–	–
MOVSW/MOVSWI	2	*2	*8	*6	Word transfer @AH+ \leftarrow @AL+, counter = RW0	–	–	–	–	–	–	–	–	–	–
MOVSWD	2	*2	*8	*6	Word transfer @AH– \leftarrow @AL–, counter = RW0	–	–	–	–	–	–	–	–	–	–
SCWEQ/SCWEQI	2	*1	*8	*7	Word retrieval (@AH+) – AL, counter = RW0	–	–	–	–	–	*	*	*	*	–
SCWEQD	2	*1	*8	*7	Word retrieval (@AH–) – AL, counter = RW0	–	–	–	–	–	*	*	*	*	–
FILSW/FILSWI	2	6m+6	*8	*6	Word filling @AH+ \leftarrow AL, counter = RW0	–	–	–	–	–	*	*	–	–	–

m: RW0 value (counter value)

n: Loop count

*1: 5 when RW0 is 0, $4 + 7 \times (\text{RW0})$ for count out, and $7 \times n + 5$ when match occurs

*2: 5 when RW0 is 0, $4 + 8 \times (\text{RW0})$ in any other case

*3: $(b) \times (\text{RW0}) + (b) \times (\text{RW0})$ when accessing different areas for the source and destination, calculate (b) separately for each.

*4: $(b) \times n$

*5: $2 \times (\text{RW0})$

*6: $(c) \times (\text{RW0}) + (c) \times (\text{RW0})$ when accessing different areas for the source and destination, calculate (c) separately for each.

*7: $(c) \times n$

*8: $2 \times (\text{RW0})$

Note: For an explanation of “(a)” to “(d)”, refer to Table 4, “Number of Execution Cycles for Each Type of Addressing,” and Table 5, “Correction Values for Number of Cycles Used to Calculate Number of Actual Cycles.”

© FUJITSU LIMITED Printed in Japan

All Rights Reserved.

The contents of this document are subject to change without notice. Customers are advised to consult with FUJITSU sales representatives before ordering.

The information and circuit diagrams in this document are presented as examples of semiconductor device applications, and are not intended to be incorporated in devices for actual use. Also, FUJITSU is unable to assume responsibility for infringement of any patent rights or other rights of third parties arising from the use of this information or circuit diagrams.

FUJITSU semiconductor devices are intended for use in standard applications (computers, office automation and other office equipment, industrial, communications, and measurement equipment, personal or household devices, etc.).

CAUTION:

Customers considering the use of our products in special applications where failure or abnormal operation may directly affect human lives or cause physical injury or property damage, or where extremely high levels of reliability are demanded (such as aerospace systems, atomic energy controls, sea floor repeaters, vehicle operating controls, medical devices for life support, etc.) are requested to consult with FUJITSU sales representatives before such use. The company will not be responsible for damages arising from such use without prior approval.

Any semiconductor devices have an inherent chance of failure. You must protect against injury, damage or loss from such failures by incorporating safety design measures into your facility and equipment such as redundancy, fire protection, and prevention of over-current levels and other abnormal operating conditions.

If any products described in this document represent goods or technologies subject to certain restrictions on export under the Foreign Exchange and Foreign Trade Law of Japan, the prior authorization by Japanese government will be required for export of those products from Japan.
