F²MC-16F MB90F244

MB90F244

■ DESCRIPTION

The MB90F244 is a 16-bit microcontroller optimized for applications in mechatronics such as HDD units. The architecture of the MB90F244 is based on the MB90242A, and embedded with a 128-Kbyte flash memory.

The instruction set is based on the AT architecture of the F²MC* family, with additional high-level language supporting instruction, expanded addressing modes, enhanced multiplication and division instructions, and improved bit processing instructions. In addition, long-word data can now be processed due to the inclusion of a 32-bit accumulator.

The MB90F244 includes a variety of peripherals on chip, such as the device is equipped with 8-channel 8/10-bit A/D converter, UART, 3-channel 16-bit reload timers, 1-channel 16-bit timer, 4-channel 16-bit input capture and 4-channel DTP/external interrupts.

Differences between the MB90F244 and MB90F243 to meet the 3.3 V ±0.3 V power supply voltage are that the power consumption of the MB90F244 is about 10% less than that of the MB90F243 and the operating frequency of the MB90F244 is up to 50 MHz from 32 MHz of the MB90F243.

* : F²MC stands for FUJITSU Flexible Microcontroller.

■ PACKAGE

80-pin Plastic TQFP

MB90F244

■ **FEATURES**

- Minimum execution time (target): 40.0 ns at 50 MHz oscillation (3.3 V ±0.3 V)
- Instruction set optimized for controller applications
  - Variety of data types: bit, byte, word, long-word
  - Expanded addressing modes: 25 types
  - High coding efficiency
  - Improvement of high-precision arithmetic operations through use of 32-bit accumulator
  - Enhanced multiplication and division instructions (signed arithmetic operations)
- Instruction set supports high-level language (C language) and multitasking
  - Inclusion of system stack pointer
  - Variety of pointers
  - High instruction set symmetry
  - Barrel shift instruction
  - Stack check function
- Improved execution speed: 8-byte queue
- Powerful interrupt functions
  - Interrupt processing time: 0.64 μs at 50 MHz oscillation
  - Priority levels: 8 levels (programmable)
  - External interrupt inputs: 4 channels
- Automatic transfer function independent of CPU
  - Extended intelligent I/O service: Max.15 channels
- 128-Kbyte flash memory
  - Access time (min.) : 80 ns
  - Sector structure of 16K + 512 $\times$ 2 + 7K + 8K + 32K + 64K
  - Program/erase operations from both EPROM programmer and CPU through built-in flash memory interface circuit
  - Built-in programming booster circuit for flash memory
- Internal RAM: 1.152 kbyte
  - According to mode settings, data stored on RAM can be executed as CPU instructions.
- General-purpose ports: Max. 63 channels (single-chip mode)
  - Max. 38 channels (external bus mode)
- 18-bit timebase timer
- Watchdog timer
- UART: 8 bits $\times$ 1 channel
- 8/16-bit I/O simple serial interface (max. 12.5 Mbps): 1 channel
- 8/10-bit A/D converter: Analog inputs: 8 channels
  - Resolution: 10 bits (switchable to 8 bits/10 bits)
  - Conversion time: Min. 1 μs
  - Conversion result store register: 4 channels
- 16-bit I/O timer
  - 16-bit free-run timer: 1 channel (operating clock: 0.16 μs)
  - 16-bit input capture: 4 channels
- 16-bit reload timer: 3 channels
- Low-power consumption modes
  - Sleep mode
  - Stop mode
  - Hardware standby mode
- Packages: TQFP-80 (FPT-80P-M15)
  - (For more information about the package, see section "■ Package Dimensions.")

■ **HANDLING DEVICES**

1. Preventing Latchup

Latchup may occur on CMOS ICs if voltage higher than V_{CC} or lower than V_{SS} is applied to the input or output pins other than medium-and high-voltage pins or if higher than the voltage which shown on "1. Absolute Maximum Ratings" in section "■ Electrical Characteristics"is applied between V_{CC} and V_{SS}.

When latchup occurs, power supply current increases rapidly might thermally damage elements. When using, take great care not to exceed the absolute maximum ratings.

In addition, for the same reasons take care to prevent the analog power supply from exceeding the digital power supply.

2. Treatment of Unused Pins

Leaving unused input pins open could cause malfunctions. They should be connected to a pull-up or pull-down resistors.

3. Precautions when Using an External Clock

When an external clock is used, drive X0 only.

• **For example an external clock**
4. Power Supply Pins

When there are several V_{CC} and V_{SS} pins, those pins that should have the same electric potential are connected within the device when the device is designed in order to prevent misoperation, such as latch-up. However, all of those pins must be connected to the power supply and ground externally in order to reduce unnecessary emissions, prevent misoperation of strobe signals due to an increase in the ground level, and to observe the total output current standards.

In addition, give a due consideration to the connection in that current supply be connected to V_{CC} and V_{SS} with the lowest possible impedance.

Finally, it is recommended to connect a capacitor of about 0.1 μF between V_{CC} and V_{SS} near this device as a bypass capacitor.

5. Crystal Oscillation Circuit

Noise in the vicinity of the X0 and X1 pins will cause this device to operate incorrectly. Design the printed circuit board so that the bypass capacitor connecting X0 and X1 pins and the crystal oscillator (or ceramic oscillator) to ground is located as close to the device as possible.

In addition, because printed circuit board artwork in which the area around the X0 and X1 pins is surrounded by ground provides stable operation, such an arrangement is strongly recommended.

6. Sequence for Applying the A/D Converter Power Supply and the Analog Inputs

Always be sure to apply the digital power supply (V_{CC}) before applying the A/D converter power supply (AV$_{CC}$, AVRH, and AVRL) and the analog inputs (AN0 to AN7).

In addition, when the power is turned off, turn off the A/D converter power supply and the analog inputs first, and then turn off the digital power supply. (Turning on or off the analog and digital power supplies simultaneously will not cause any problems.)

Whether applying or cutting off the power, be certain that AVRH does not exceed AV$_{CC}$.

7. External Reset Input

To reliably reset the controller by inputting an "L" level to the $\overline{RST}$ pin, ensure that the "L" level is applied for at least five machine cycles.

8. $\overline{HST}$ Pin

When turning on the system, be sure to set the $\overline{HST}$ pin to "H" level. Never set the $\overline{HST}$ pin to "L" level while the $\overline{RST}$ pin is in "L" level.

9. CLK Pin
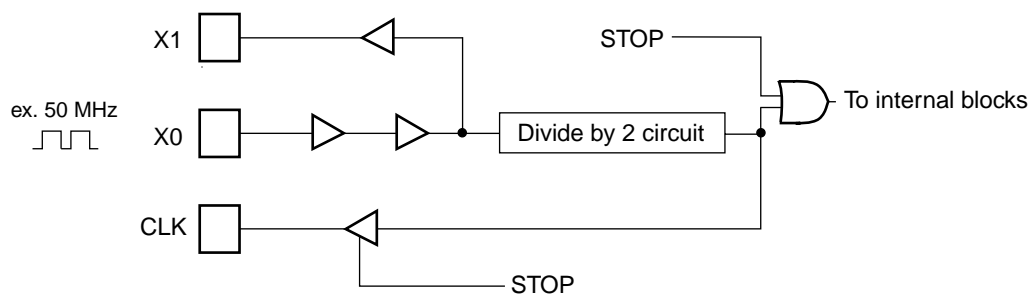

Note: CLK pin cannot use as I/O port.
Care must be taken that this is different from standard specification for F²MC-16F family.

MB90F244

10.Specifed Interrupt Sequence

When the interrupt stack area is allocated to the external memory, even if the higher priority level interrupt may generate while the former interrupt is waiting in the stack area, the latter higher priority level interrupt routine has to wait untill the former interrupt routine is excuted. In this case the former interrupt routine is excuted in the latter higher priority level.

Explanation of read/write
  R/W : Readable and writable
  R : Read only
  W : Write only

Explanation of initial values
  0 : The initial value of this bit is "0".
  1 : The initial value of this bit is "1".
  X : The initial value of this bit is undefined.
  − : This bit is unused. No initial value is defined.

*1: Access prohibited.
*2: The initial values are changed depending on a bus mode.
*3: The only area available for the external access below address 0000FF$_H$ is this area. Addresses not explained in the table are "(reserved area)"; accesses to these areas are handled accesses to internal areas. No access signal is generated for the external bus.

Note: Do not use any "(vacancy)".

Power consumption	P_D	—	350	mW	
Operating temperature	T_A	0	+70	°C	
Storage temperature	Tstg	−55	+125	°C	

*1: $V_{CC}5$ must always exceed V_{CC}.
*2: AV_{CC}, AVRH and AVRL must not exceed V_{CC}. Also AVRL must not exceed AVRH.
*3: V_{I1} and V_O must not exceed $V_{CC} + 0.3$ V.
*4: V_{I2} must not exceed $V_{CC}5 + 0.3$ V.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.

2. Recommended Operating Conditions

$(AV_{SS} = V_{SS} = 0.0 \text{ V})$

Parameter	Symbol	Value		Unit	Remarks
		Min.	Max.		
Power supply voltage	V_{CC}	3.0	3.6	V	Normal operation
	V_{CC}	3.0	3.6	V	Maintaining the stop status
	$V_{CC}5$	4.5	5.5	V	
Operating temperature	T_A	0	+70	°C	

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their FUJITSU representatives beforehand.

*1: Because the current values are tentative values, they are subject to change without notice due to our efforts to improve the characteristics of these devices.

*2: To prevent improper commands from being activated during rise and fall of $V_{CC}5$, the internal $V_{CC}5$ detection circuit of the flash memory allows only read accesses and ignores write accesses while $V_{CC}5$ is lower than V_{LKO}.

The minimum value of the ADCT resister is #A224, differs from that of the MB90F243.

*2: Current when the A/D converter is not operating and the CPU is stopped.

Notes:
- The smaller | AVRH − AVRL |, the greater the error would become relatively.
- If the output impedance of the external circuit for the analog input is high, sampling period might be insufficient. When the sampling period set at near the minimum value, the output impedance of the external circuit should be less than approximately 300 Ω.

6. A/D Converter Glossary

- **Resolution**

 Analog changes that are identifiable with the A/D converter.
When the number of bits is 10, analog voltage can be divide into 2^{10} .

- **Linearity error (unit: LSB)**

The deviation of the straight line connecting the zero transition point ("00 0000 0000" $\leftrightarrow$ "00 0000 0001") with the full-scale transition point ("11 1111 1110" $\leftrightarrow$ "11 1111 1111") from actual conversion characteristics

- **Differential linearity error**

The deviation of input voltage needed to change the output code by 1 LSB from the theoretical value

- **Total error (unit: LSB)**

The difference between theoretical and actual conversion values caused by the zero transition error, full-scale transition error, non-linearity error, differential linearity error, and noise

$$1 \text{ LSB} = \frac{V_{FST} - V_{OT}}{1022} \text{ [V]}$$

$$\text{Digital output N linearity error} = \frac{V_{NT} - (1 \text{ LSB} \times N + V_{OT})}{1 \text{ LSB}} \text{ [LSB]}$$

$$\text{Digital output N differential linearity error} = \frac{V_{(N+1)T} - V_{NT}}{1 \text{ LSB}} - 1 \text{ LSB [LSB]}$$

V_{OT}: Voltage for digital output transit from "000$_H$" to "001$_H$"
V_{FST}: Voltage for digital output transit from "3FE$_H$" to "3FF$_H$"

Table 1   Explanation of Items in Table of Instructions

Item	Explanation
Mnemonic	Upper-case letters and symbols: Represented as they appear in assembler Lower-case letters: Replaced when described in assembler. Numbers after lower-case letters: Indicate the bit width within the instruction.
#	Indicates the number of bytes.
~	Indicates the number of cycles. See Table 4 for details about meanings of letters in items.
B	Indicates the correction value for calculating the number of actual cycles during execution of instruction. The number of actual cycles during execution of instruction is summed with the value in the "cycles" column.
Operation	Indicates operation of instruction.
LH	Indicates special operations involving the bits 15 through 08 of the accumulator. 　　　Z: Transfers "0". 　　　X: Extends before transferring. 　　　—: Transfers nothing.
AH	Indicates special operations involving the high-order 16 bits in the accumulator. 　　　*: Transfers from AL to AH. 　　　—: No transfer. 　　　Z: Transfers 00_H to AH. 　　　X: Transfers 00_H or FF_H to AH by extending AL.
I S T N Z V C	Indicates the status of each of the following flags: I (interrupt enable), S (stack), T (sticky bit), N (negative), Z (zero), V (overflow), and C (carry). 　　　*: Changes due to execution of instruction. 　　　—: No change. 　　　S: Set by execution of instruction. 　　　R: Reset by execution of instruction.
RMW	Indicates whether the instruction is a read-modify-write instruction (a single instruction that reads data from memory, etc., processes the data, and then writes the result to memory.). 　　　*: Instruction is a read-modify-write instruction 　　　—: Instruction is not a read-modify-write instruction 　　　Note: Cannot be used for addresses that have different meanings depending on whether they are read or written.

For an explanation of "(b)" and "(c)", refer to Table 5, "Correction Values for Number of Cycles Used to Calculate Number of Actual Cycles."

 *1: 3 when dividing into zero, 8 or 18 when an overflow occurs, and 18 normally.
 *2: 3 when dividing into zero, 10 or 21 when an overflow occurs, and 22 normally.
 *3: 4 + (a) when dividing into zero, 11 + (a) or 22 + (a) when an overflow occurs, and 23 + (a) normally.
 *4: When the dividend is positive: 4 when dividing into zero, 10 or 29 when an overflow occurs, and 30 normally.
      When the dividend is negative: 4 when dividing into zero, 11 or 30 when an overflow occurs, and 31 normally.
 *5: When the dividend is positive: 4 + (a) when dividing into zero, 11 + (a) or 30 + (a) when an overflow occurs, and 31 + (a) normally.
      When the dividend is negative: 4 + (a) when dividing into zero, 12 + (a) or 31 + (a) when an overflow occurs, and 32 + (a) normally.
 *6: (b) when dividing into zero or when an overflow occurs, and 2 × (b) normally.
 *7: (c) when dividing into zero or when an overflow occurs, and 2 × (c) normally.
 *8: 3 when byte (AH) is zero, 12 when the result is positive, and 13 when the result is negative.
 *9: 3 when byte (ear) is zero, 12 when the result is positive, and 13 when the result is negative.
*10: 4 + (a) when byte (eam) is zero, 13 + (a) when the result is positive, and 14 + (a) when the result is negative.
*11: 3 when word (AH) is zero, 12 when the result is positive, and 13 when the result is negative.
*12: 3 when word (ear) is zero, 16 when the result is positive, and 19 when the result is negative.
*13: 4 + (a) when word (eam) is zero, 17 + (a) when the result is positive, and 20 + (a) when the result is negative.

Note: Which of the two values given for the number of execution cycles applies when an overflow error occurs in a DIV or DIVW instruction depends on whether the overflow was detected before or after the operation.
