### DESCRIPTION

These devices are analog multiplexer demultiplexers in high speed silicon gate  $C^2MOS$  technology. These analog switches are bidirectional and digitally controlled. A built-in level shifting is included to allow them a control input range of up to  $\pm 6V$  (peak) for an analog signal with digital control signal of 0 to 6V.

$V_{EE}$  supply pin is provided for analog input signals. They have two enable inputs to enable all the switches when high ( $\overline{EN2}$ ) or low ( $\overline{EN1}$ ). For operation as a digital multiplexer/demultiplexer,  $V_{EE}$  is connected to GND.

The HC4351 is a single 8 channel multiplexer demultiplexer having three binary control inputs A, B and C to select 1 of 8 to be turned on, and connected to the output.

The HC4352 has a pair of four channel multiplexer demultiplexer having two control inputs A and B that select one of four channel of the two sections.

The HC4353 is a triple two channel multiplexer demultiplexer having three separate digital control inputs A, B and C to select independently one of a pair of channels.
