Frequency counter

(1) Structure

- (2) How the frequency counter operates  
When control data CT equals 1, the 20-bit counter and the amp go into operation. When CT equals 0, amp input goes to pulldown and the counter is reset. Measuring time (gate pulse) is selected (8mSEC/16mSEC) on the basis of control data GT. When control data CT equals 0, the counter is reset.

- (3) Explanation of output data  
D0 : LSB D19 : MSB

Unlock detection

When control data GT equals 1, or CT equals 1, the unlock detection circuit goes into operation for 8 mSEC. When CT equals 1, the unlock detection circuit stops operating before the frequency counter gate pulse is emitted. When CT equals 0, or GT equals 0, the unlock detection circuit is re-set.

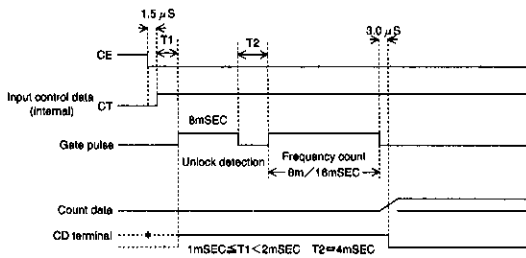

Explanation of the output data

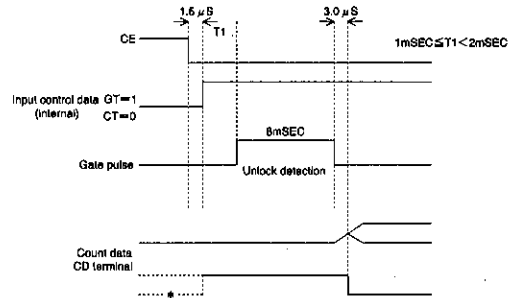

U0	U1	U2	U3	ERR	ERR
0	0	0	0	<	1.1 μSEC
1	0	0	0	<	2.2 μSEC
1	1	0	0	<	3.3 μSEC
1	1	1	0	<	4.4 μSEC
1	1	1	1	<	ERR

Frequency counter and unlock detection

- (1) When CT = 1 : Frequency count and unlock detection are carried out.

- (2) When CT = 0 and GT = 1 : Only unlock detection is carried out.

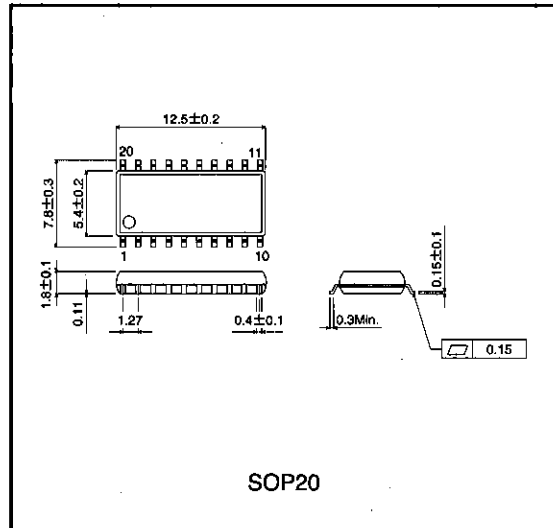

Explanation of CD terminal

When frequency measurement or unlock detection is finished, the CD terminal goes to LO to indicate that the count and unlock detection have finished. It also synchronizes with CK to output counter data. When the next data is input, it goes to HI.

\* When CT or GT = 0, the input terminal data selected on the basis of the control data IS will appear. 10 (11-pin) input is displayed in reverse video, while 11 (12-pin) is not.
