1 MEG (65536 words × 16 bits) DRAM Fast Page Mode, Byte Write

Overview

The LC321664BJ, BM, BT is a CMOS dynamic RAM operating on a single 5 V power source and having a 65536 words × 16 bits configuration. Equipped with large capacity capabilities, high speed transfer rates and low power dissipation, this series is suited for a wide variety of applications ranging from computer main memory and expansion memory to commercial equipment.

Address input utilizes a multiplexed address bus which permits it to be enclosed in a compact plastic package of 40-pin SOJ. Refresh rates are within 4 ms with 256 row address (A0 to A7) selection and support Row Address Strobe ($\overline{RAS}$)-only refresh, Column Address Strobe ($\overline{CAS}$)-before-$\overline{RAS}$ refresh and hidden refresh settings. There are functions such as fast page mode, read-modify-write and byte write.

Input/Output Capacitance at Ta = 25°C, f = 1 MHz, V_{CC} = 5 V ± 10%

Parameter	Symbol	min	max	Unit	Note
Input capacitance (A0 to A7, $\overline{RAS}$, $\overline{CAS}$, $\overline{UW}$, $\overline{LW}$, $\overline{OE}$)	C_{IN}		7	pF	
Input/Output capacitance (I/O1 to I/O16)	$C_{I/O}$		7	pF	

Note:
6. An initial pause of 200 µs is required after power-up followed by eight $\overline{RAS}$-only refresh cycles before proper device operation is achieved. In case of using refresh counter, a minimum of eight $\overline{CAS}$-before-$\overline{RAS}$ refresh cycles instead of eight $\overline{RAS}$-only refresh cycles are required.
7. Measured at t_T = 5 ns.
8. When measuring input signal timing, V_{IH} (min) and V_{IL} (max) are used for reference points. In addition, rise and fall time are defined between V_{IH} and V_{IL}.
9. Measured using an equivalent of 50 pF and one standard TTL loads.
10. t_{OFF} (max) and t_{OEZ} (max) are defined as the time until output voltage can no longer be measured when output switches to a high impedance condition.
11. Operation is guaranteed if either t_{RRH} or t_{RCH} is satisfied.
12. These parameters are measured from the falling edge of $\overline{CAS}$ for an early-write cycle, and from the falling edge of $\overline{UW}$ and $\overline{LW}$ for a read-write/read-modify-write cycle.
13. t_{WCS}, t_{CWD}, t_{RWD}, t_{AWD} and t_{CPWD} are not restrictive operating parameters for memory in that they specify the operating mode. If $t_{WCS} \geq t_{WCS}$ (min), the cycle switches to an early-write cycle and output pins switch to high impedance throughout the cycle.
If $t_{CWD} \geq t_{CWD}$ (min), $t_{RWD} \geq t_{RWD}$ (min), $t_{AWD} \geq t_{AWD}$ (min) and $t_{CPWD} \geq t_{CPWD}$ (min) for fast page mode cycle only, the cycle switches to a read-write/read-modify-write cycle and data output equal information in the selected cells. If neither of the above timings are satisfied, output pins are in an undefined state.
14. t_{RCD} (max) is not a restrictive operating parameter but instead represents the point at which the access time t_{RAC} (max) is guaranteed. If $t_{RCD} \geq t_{RCD}$ (max), access time is determined according to t_{CAC}.
15. t_{RAD} (max) is not a restrictive operating parameter but instead represents the point at which the access time t_{RAC} (max) is guaranteed. If $t_{RAD} \geq t_{RAD}$ (max), access time is determined according to t_{AA}.
16. Operation is guaranteed if either t_{DZC} or t_{DZO} is satisfied.
