

**SANYO**No. ~~X~~ 5398**LC361000AMLL, ATLL, ARLL-70/10****1 MEG (131072 words × 8 bits) SRAM****Preliminary****Overview**

The LC361000AMLL, ATLL, and ARLL are 131072 words × 8 bits asynchronous silicon gate CMOS static RAMs. These SRAMs have two chip enable pins (CE1 and CE2) for controlling the device selected/unselected state and one output enable pin ( $\overline{OE}$ ) for output control and feature high speed and low power. This makes these SRAMs optimal for systems that require high speed, low power, and battery backup, and they furthermore allow easy expansion of memory capacity.

- Note: 1.  $t_{COD1}$ ,  $t_{COD2}$ ,  $t_{OOD}$ , and  $t_{WOD}$  are stipulated as the time until the outputs reach the high-impedance state, and are not determined by the output voltage levels.  
 2. Reverse phase signals must not be applied externally when the data outputs are in the output state.  
 3.  $t_{WP}$  is defined as the period when  $\overline{CE1}$  and  $\overline{WE}$  are low and  $\overline{CE2}$  is high, from the falling edge of  $\overline{WE}$  until either a rising edge of  $\overline{CE1}$  or  $\overline{WE}$  or a falling edge of  $\overline{CE2}$ , whichever of these happens first.  
 4.  $t_{WC1}$  and  $t_{WC2}$  are defined as the periods when  $\overline{CE1}$  and  $\overline{WE}$  are low and  $\overline{CE2}$  is high, from either a falling edge of  $\overline{CE1}$  or a rising edge of  $\overline{CE2}$ , until a rising edge of  $\overline{CE1}$  or  $\overline{WE}$ , or a falling edge of  $\overline{CE2}$ , whichever happens first.  
 5. The data outputs will be in the high-impedance state if either  $\overline{OE}$  is high,  $\overline{CE1}$  is high,  $\overline{CE2}$  is low, or  $\overline{WE}$  is low.  
 6. If  $\overline{OE}$  goes high during a write cycle, the data outputs will go to the high-impedance state.
