Preliminary

Overview

The LC36256AL, AML-70W/85W/10W/12W are fully asynchronous silicon gate CMOS static RAMs with an 32768 words × 8 bits.

This series has \overline{CE} chip enable pin for device select/nonselect control and an \overline{OE} output enable pin for output control, and features high speed, a wide temperature operating range, as well as low power dissipation.

For these reasons, the series is especially suited for use in systems requiring high speed, low power, and battery backup, and it is easy to expand memory capacity.

- Notes: (1) t_{COD} , t_{OOD} , and t_{WOD} are defined as the time at which the outputs becomes the high impedance state and are not referred to output voltage levels.
 (2) An external antiphase signal must not be applied when D_{OUT} is in the output state.
 (3) t_{WP} is the time interval that \overline{CE} and \overline{WE} are low-level and is defined as the interval from the falling of \overline{WE} to the rising of \overline{CE} or \overline{WE} whichever is earlier.
 (4) t_{CW} is the time interval that \overline{CE} and \overline{WE} are low-level and is defined as the time from the falling of \overline{CE} to the rising of \overline{CE} or \overline{WE} whichever is earlier.
 (5) D_{OUT} goes to the high-impedance state when either \overline{OE} is high-level, \overline{CE} is high-level, or \overline{WE} is low-level.
 (6) When \overline{OE} is high-level during the write cycle, D_{OUT} goes to the high-impedance state.
