

8 BIT ADDRESSABLE LATCH/DECODER/RELAIS DRIVER (OPEN DRAIN, INVERTING OUTPUT)

- LOW POWER DISSIPATION
I_{CC} = 4 μA (MAX.) AT T_A = 25 °C
- COMPATIBLE WITH TTL OUTPUTS
V_{IH} = 2V (MIN) V_{IL} = 0.8V (MAX)
- OUTPUT DRIVE CAPABILITY
90 LSTTL LOADS
- HIGH CURRENT OPEN DRAIN OUTPUT UP TO 80 mA

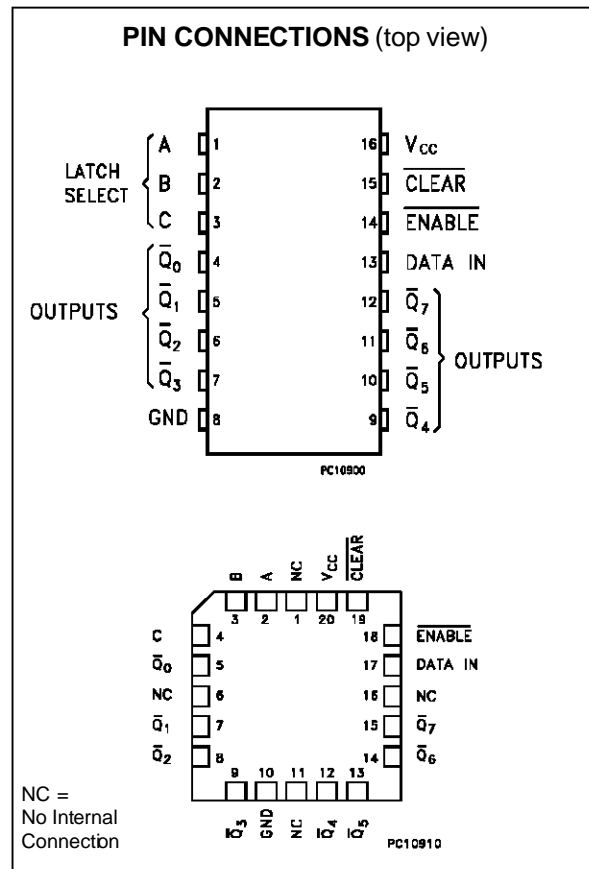

DESCRIPTION

The **M74HCT7259** is a high speed CMOS 8 BIT ADDRESSABLE LATCH/DECODER fabricated in silicon gate C2MOS technology. It has the same high speed performance of LSTTL combined with true CMOS low power consumption.

The **M74HCT7259** has single data input (D) 8 LATCH inverted OUTPUTS (Q₀-Q₇), 3 address inputs (A, B and C), common enable input (ENABLE) and a common CLEAR input. To operate this device as an addressable latch, data is held on the D input, and the address of the latch into which the data is to be entered is held on the A, B and C inputs.

When ENABLE is taken low the data flows through to the address output. The data is stored on the positive-going edge of the ENABLE pulse. All unaddressed latches will remain unaffected. With ENABLE in the high state the device is deselected and all latches remain in their previous state, unaffected by changes on the data or address inputs. To eliminate the possibility of entering erroneous data into the latches, the ENABLE should be held high

INPUT AND OUTPUT EQUIVALENT CIRCUIT

(inactive) while the address lines are changing. If $\overline{\text{ENABLE}}$ is held high and $\overline{\text{CLEAR}}$ is taken low all eight latches are cleared to the HIGH (OFF) state. If $\overline{\text{ENABLE}}$ is low all latches except the addressed latch will be cleared. The address latch will instead be the complement of the D input, effectively imple-

menting a 3 to 8 line decoder. Internal clamp diodes protect the open drain outputs against over voltages due to inductive loads.

All inputs are equipped with protection circuits against static discharge and transient excess voltage.
