STK6713BMK4**Unipolar Fixed-Current Chopper-Type
4-Phase Stepping Motor Driver****Overview**

The STK6713BMK4 is a unipolar fixed-current chopper-type 4-phase stepping motor driver hybrid IC (HIC) which uses a MOSFET power device. The excitation sequence signal is active low.

Applications

- Serial printer, line printer, and laser beam printer (LBP) paper feed and carriage motor drivers
- PPC scanner and LBP paper feed drivers
- XY plotter pen drivers
- Industrial robot applications, etc.

Features

- This IC has the features of the STK6713BMK3, plus a simultaneous input prevention circuit that protects the IC from any malfunction of the excitation signal.
- Self-excitation design means chopping frequency is determined by motor L and R. Supports chopping at 20 kHz or higher.
- Very low number of external components required.
- Wide operating supply voltage range ($V_{CC1} = 18$ to 42V)
- Excitation sequence signal is active low, and is TTL level for direct interfacing to the microcomputer and gate array.
- The unipolar design enables use as a driver for hybrid, PW, or VR type stepping motors.
- Supports W1-2 phase operation, with a dual Vref pin.

Package Dimensions

unit: mm

Specifications

Maximum Ratings at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Maximum supply voltage 1	$V_{CC1 \text{ max}}$	No input signal	52	V
Maximum supply voltage 2	$V_{CC2 \text{ max}}$	No input signal	7	V
Maximum phase current	$I_{OH \text{ max}}$	per phase, $R/L = 5 \Omega, 10 \text{ mH}, 0.5 \text{ s } 1 \text{ pulse}, V_{CC}$ input	3.9	A
Substrate temperature	$T_c \text{ max}$		105	$^\circ\text{C}$
Junction temperature	$T_J \text{ max}$		150	$^\circ\text{C}$
Storage temperature	T_{stg}		-40 to +125	$^\circ\text{C}$
Repeated avalanche resistance	$E_{ar \text{ max}}$		42	mJ

Allowable Operating Ranges at $T_a = 25^\circ\text{C}$

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage 1	V_{CC1}	With input signal	18 to 42	V
Supply voltage 2	V_{CC2}	With input signal	4.75 to 5.25	V
Phase driver voltage resistance	V_{DSS}		(min) 100	V
Phase current	$I_{OH \text{ max}}$	Duty 50%	(max) 3.0	A

Junction Thermal Resistance

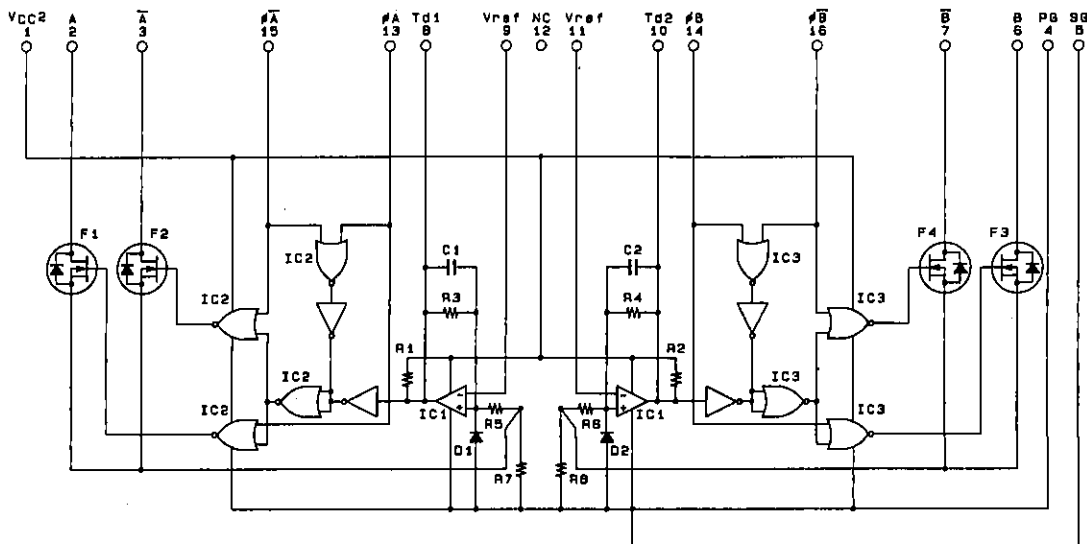

Parameter	Symbol	Conditions	Ratings	Unit
Power FET	θ_{j-c}		7.0	$^\circ\text{C/W}$

Electrical Characteristics at $T_c = 25^\circ\text{C}, V_{CC1} = 36 \text{ V}, V_{CC2} = 5 \text{ V}$

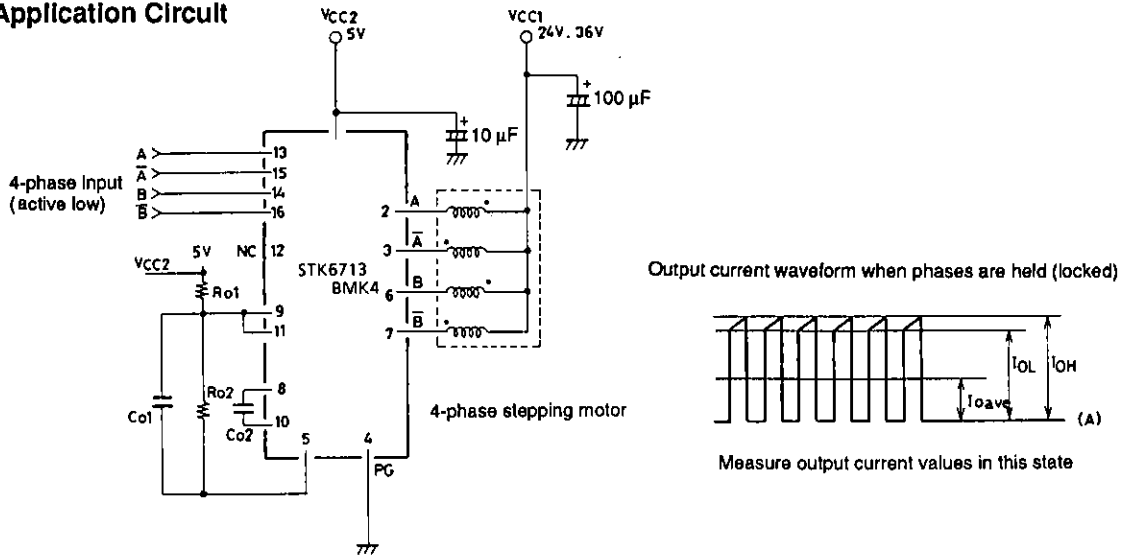

Parameter	Symbol	Conditions	min	typ	max	Unit
Output saturation voltage	V_{ST}	$R_L = 23 \Omega, V_{IN} = 0.8 \text{ V}$		1.5	2.1	V
Output current (average)	$I_{o \text{ ave}}$	$R/L = 3.5 \Omega/3.8 \text{ mH}, V_{IN} = 0.8 \text{ V per phase}$	0.414	0.460	0.506	A
Pin current dissipation (average)	I_{CC2}	Load: $R = 3.5 \Omega, L = 3.8 \text{ mH}, V_{IN} = 0.8 \text{ V per phase}$		10	20	mA
FET diode voltage	V_{df}	$I_{df} = 1.0 \text{ A}$		1.2	1.8	V
TTL input ON voltage	V_{IH}	Input voltage when F1, 2, 3, 4 OFF	2.0			V
TTL input OFF voltage	V_{IL}	Input voltage when F1, 2, 3, 4 ON			0.8	V
Switching time	t_{ON}	$R_L = 24 \Omega, V_{IN} = 0.8 \text{ V}$		125		ns
	t_{OFF}	$R_L = 24 \Omega, V_{IN} = 0.8 \text{ V}$		200		ns

Note: With constant voltage power supply.

Internal Equivalent Circuit

Sample Application Circuit

Note: For reference, when $I_{OH} \approx 1.1 \text{ A}$, $R_{O1} = 6.8 \text{ k}\Omega$ and $R_{O2} = 390 \Omega$.

$$I_{OH} = K \times \frac{R_{O2}}{R_{O1} + R_{O2}} \times V_{CC2}/R_7$$

$$K \approx 1.3$$

$$R_7 = R_8 \approx 0.33 \Omega \pm 3\%$$

To reduce noise during motor hold, it is possible to mount $C_{O1} \approx 0.01 \mu\text{F}$ and $C_{O2} = 100\text{-}200 \text{ pF}$. Normally these are not required.

STK6713BMK4 Circuit Operation

Fig. 1 STK6713BMK4 Internal Equivalent Circuit

100300

The operation for a 4-phase dual-excitation example is described below.

The STK6713BMK4 equivalent circuit is given in Fig. 1. The circuit consists of the phase drivers, the comparator, the PWM excitation select and the current detect resistance. In Fig. 1 ϕA is input with low, and ϕA with high. When Q1 goes on, the +pin of IC1 (comparator) goes low, making IC1 output \textcircled{C} low also. A winding current i_{ON} through Q1 increases as:

$$i_{ON} = \frac{V_{CC1} - V_{SAT}}{R} (1 - e^{-\frac{R}{L}t}) \dots \dots \dots (1)$$

L: motor winding inductance

R: Sum of winding resistance and current detect resistance

For this reason, pin voltage V_{R7} at source resistor R7 increases, and when the V_{RO2} voltages of pin 8 and R_{O2} are equal output A goes high, and Q1 turns off. The inverse voltage V_{TP} is as:

$$V_{TP} = V_{ref} = \frac{R_{O2}}{R_{O1} + R_{O2}} \times V_{CC2} \dots \dots \dots (2)$$

In general stepping motor coils use BIFALAR windings, so the energy stored in L1 is generated by L2, at which time the current in L2 is i_{OFF} . i_{OFF} conduction continues until the charges of capacitors C1 and C2 on R3 and R4 pins (E_C) equal V_{RO2} . When they are equal, output \textcircled{C} inverts and becomes low. Motor winding current i_{ON} again rises to V_{RO2} level. This motor current on/off (constant current chopping) is repeated. This waveform is illustrated on the next page.

STK6713BMK4 Excitation Circuit

Setting Output Current

The motor output current waveform is shown to the right. Output current I_{OH} can be set by the user by adjusting the voltage of pin 9 (11). The computation equation is indicated below.

$$V_{ref} = \frac{R_{O2}}{R_{O1} + R_{O2}} \times V_{CC2} \dots \dots \dots (3)$$

$$I_{OH} \approx K \times \frac{V_{ref}}{R_S} \dots \dots \dots (4)$$

- R_S : Internal current detect resistance (0.33 ± 3%)
- K: 1.1 to 1.2 (correction for actual measurement)

Power down can be accomplished by reducing the synthetic impedance by connecting a resistance in parallel to R_{O2} . The motor output current variation range can be set for the range of:

$$I_{OH} = 0.2 \text{ A to } 3.0 \text{ A}$$

but when set to $I_{OH} = 0.2 \text{ A}$ or lower note that the HIC GND pattern will be one-point earth with respect to the power supply. If earth is poor, there may be no motor current when $I_{OH} = 0.2 \text{ A}$.

Fig. 3 Output Motor Current Waveform

Fig. 4 Vref Peripheral Circuit

Determining Chopping Frequency

The STK6713BMK4 uses constant current for self-excitation.

The t_{OFF} time of I_{OH} is set to about 14 μs (when $I_{OH} = 1.0 A$), and the t_{ON} time can be expressed as:

$$t_{ON} \approx \frac{L}{R + 0.55} \ln \left(\frac{V_{CC} - (I_{OH} e^{-\frac{R}{L} t_{OFF}} - \frac{V_{CC} + 0.55}{R} (1 - e^{-\frac{R}{L} t_{OFF}})) (R + 0.55)}{V_{CC} - (R + 0.55) I_{OH}} \right) \dots\dots\dots (5)$$

- L: Motor winding inductance
- R: Motor resistance
- V_{CC} : Motor supply voltage
- I_{OH} : Output current

As a result, the chopping frequency is

$$F \approx \frac{1}{t_{ON} + t_{OFF}} = \frac{1}{t_{ON} + 14 \times 10^{-6}} \text{ (Hz)} \dots\dots\dots (6)$$

However, note that when the following conditions exist the value for F will change.

$$14 \times 10^{-6} \geq \frac{-L}{R} \ln \left(\frac{V_{CC} + 0.55}{I_{OH} \times R + V_{CC} + 0.55} \right) = t_{OFF2} \dots\dots\dots (7)$$

$$t_{OFF} \approx t_{OFF1} + t_{OFF2} = 14 \times 10^{-6} + t_{OFF}$$

$$\therefore F = \frac{1}{t_{ON} + 14 \times 10^{-6} + t_{OFF2}} \text{ (Hz)} \dots\dots\dots (8)$$

Because the STK6713BMK4 is self-exciting there will be minor variation in motor inductance during motor revolution. Final design verification is required in an actual model.

Thermal Radiation Design

The HIC radiator plate size is dependent on the motor output current I_{OH} (A), motor electrical characteristics, excitation mode, and excitation input signal clock frequency f_{clock} (Hz).

The thermal resistance for the radiator can be determined from the following expression.

$$\theta_{c-a} = \frac{T_c \text{ max} - T_a}{P_d} \text{ (}^\circ\text{C/W)} \dots\dots\dots (9)$$

- $T_c \text{ max}$ = HIC substrate temperature ($^\circ\text{C}$)
- T_a = set internal temperature ($^\circ\text{C}$)
- P_d = HIC internal mean power dissipation (W)

With a 2.00 mm aluminum radiation plate, the required area can be determined from Fig. 6. Note that substrate temperature will vary widely with set internal air temperature, and therefore the rear side of the HIC (the aluminum plate side) must always be kept below the maximum temperature of 105°C.

Fig. 5

Fig. 6

HIC Internal Mean Power Dissipation Pd

The internal mean power dissipation of the STK6713BMK4 is primarily due to the current control device, the regenerating current diode, the current detect resistance and the predriver circuit.

Loss in each excitation mode is:

$$2 \text{ phase excitation } Pd_{2EX} \approx (V_{st} + V_{df}) \frac{f_{clock}}{2} I_{OH} t_2 + \frac{f_{clock}}{2} I_{OH} (V_{st} \times t_1 + V_{df} \times t_3) \dots\dots\dots (10)$$

$$1-2 \text{ phase excitation } Pd_{1-2EX} \approx (V_{st} + V_{df}) \frac{3I_{OH}t_2}{8} f_{clock} + \frac{3I_{OH}}{3} f_{clock} (V_{st} \times t_1 + V_{df} \times t_3) \dots\dots\dots (11)$$

- Vst: R_{ON} voltage drop + R7 (R8) output voltage
- Vdf: FET internal diode + R7 (R8) output voltage
- fclock: Input clock (reference frequency before frequency divider)

t1, t2 and t3 are the time modes for the waveform indicated below.

- t1: Time for winding current to rise to set current
- t2: Time for constant current chopping region
- t3: Time from end of phase input signal until inverse current regeneration is complete.

Fig. 7 Motor Output Current Waveform (model)

$$t1 \approx \frac{-L}{R + 0.55} \ln \left(1 - \frac{R + 0.55}{V_{CC}} \times I_{OH} \right) \dots\dots\dots (12)$$

$$t3 \approx \frac{-L}{R} \ln \left(\frac{V_{CC} + 0.55}{I_{OH} \cdot R + V_{CC} + 0.55} \right) \dots\dots\dots (13)$$

- V_{CC}: Motor supply voltage (V)
- L: Motor inductance (H)
- R: Motor internal resistance (Ω)
- I_{OH}: Motor output current peak (A)

The chopping frequency F and t₂ for each excitation mode are:

$$2 \text{ phase excitation } F = f_{clock}/2, t_2 = (1/F) - (t_1 + t_3) \dots\dots\dots (14)$$

$$1-2 \text{ phase excitation } F = 3f_{clock}/8, t_2 = (1/F) - t_1 \dots\dots\dots (15)$$

f_{clock}: 4-phase divider input oscillation frequency

The characteristic diagrams (typ) for I_{OH} and V_{st}, and I_{OH} and V_{df} are given in Figs. 8 and 9.

Fig. 8

Fig. 9

STK6713BMK4 No Thermal Radiation Range (example)

An example of STK6713BMK4 use in the no-fin state is indicated below.

Conditions:

- Motor supply voltage V_{CC1} = 30 V, stepping motor: Electrical characteristics 3.5 mH/φ, 3.5 Ω/φ
- Excitation: 2-phase
- Input clock frequency 500 Hz = f_{clock}
- HIC ambient temperature Ta = 25°C, natural convection
- HIC rear substrate temperature Tc = 105°C saturation
- Motor output current I_{OH} = 1.8 A

At this time, the HIC permissible loss can be calculated as:

$$\text{Maximum loss: } Pd \text{ max} = \frac{Tc \text{ max} - Ta}{\theta_c - a} = \frac{105 - 25}{16.5} = 4.8 \text{ (W)} \dots\dots\dots (16)$$

From these conditions and expressions (12), (13) and (14):

$$\begin{aligned}
 t1 &= 0.243 \text{ ms} \\
 t2 &= 3.570 \text{ ms} \\
 t3 &= 0.185 \text{ ms}
 \end{aligned}$$

Referring to Figs. 8 and 9, each value for Vst and Vdf is determined by expression (10) as follows :

$$\begin{aligned}
 Pd2_{EX} &= (Vst + Vdf) \frac{fclock}{2} I_{OH}t2 + \frac{fclock}{2} I_{OH} (Vst \times t1 + Vdf \times t3) \dots\dots\dots (17) \\
 &= 4.33 + 0.27 = 4.60 \text{ (W)}
 \end{aligned}$$

From expression (9), Tc is calculated as:

$$Tc = Pd2_{EX} \times \theta_c - a + Ta = 4.60 \times 16.5 + 25 \approx 101 \text{ (}^\circ\text{C)} \dots\dots\dots (18)$$

This is only one example, and because convection and other air movements around the HIC will not match mathematical modelling verification with an actual model is essential.

Motor hold noise countermeasures

The STK6713BMK4 executes constant current chopping outside the audible range. During motor hold the current hold is outside the range of audible frequencies, but for motors of sizes 30 to 40 mm square (when seen from the shaft direction) with inductance of about 15 mH, there are cases where the output noise is converted to low-frequency noise. In this case, addition of the following components will essentially eliminate such audible noise.

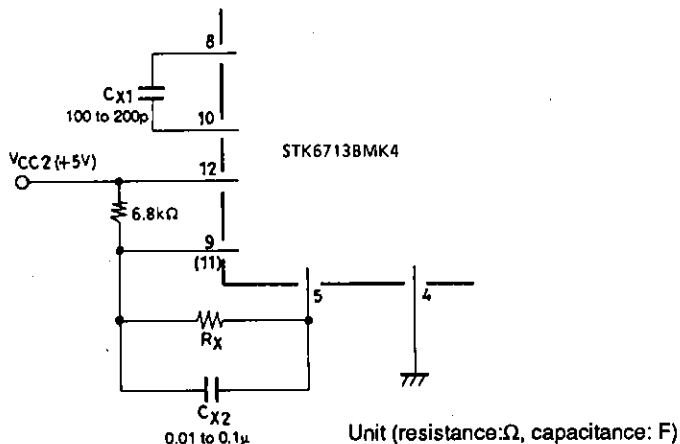

Fig. 10: Motor Hold Noise Countermeasure
