## 5 V mixer/oscillator-PLL synthesizers for hyperband tuners

## TDA6404; TDA6405; TDA6405A

## FEATURES

- Single chip 5 V mixer/oscillator-PLL synthesizer for hyperband tuners
- $\mathrm{I}^{2} \mathrm{C}$-bus protocol
- 3 PNP band switch buffers ( 25 mA )
- 33 V tuning voltage output
- In-lock detector
- 5-level Analog-to-Digital Converter (ADC)
- 15-bit programmable divider
- Programmable reference divider ratio (512, 640 or 1024)
- Programmable charge pump current
- Balanced mixer with a common emitter input for VHF (single input)
- Balanced mixer with a common base input for UHF (double input)
- 4-pin common emitter oscillator for VHF
- 4-pin common emitter oscillator for UHF
- IF amplifier with a low output impedance to drive a SAW filter directly ( $\approx 2 \mathrm{k} \Omega$ load)
- Low power, low radiation, small size

## APPLICATIONS

- Hyperband tuners for Europe using a 2-band mixer/oscillator in a switched concept.

## GENERAL DESCRIPTION

The TDA6404, TDA6405 and TDA6405A are programmable 2-band mixer/oscillator-PLL synthesizers intended for VHF/UHF and hyperband tuners (see Fig.1).

The devices include two double balanced mixers and two oscillators for the VHF and UHF band, an IF amplifier and a PLL synthesizer. With proper oscillator application and by using a switchable inductor to split the VHF band into two sub-bands (the full VHF/UHF and hyperband) the TV bands can be covered.

Two pins are available between the mixer output and the IF amplifier input to enable IF filtering for improved signal handling. Three PNP ports are provided for band switching. Band selection is made according to the band switch bits VHFL, VHFH and UHF.

The PLL synthesizer consists of a divide-by-eight prescaler, a 15 -bit programmable divider, a 4 MHz crystal oscillator and its programmable reference divider and a phase comparator combined with a charge pump which drives the tuning amplifier, including 33 V output.

Depending on the reference divider ratio (512, 640 or 1024), the phase comparator operates at 7.8125 kHz , 6.25 kHz or 3.90625 kHz .

The devices are controlled according to the $\mathrm{I}^{2} \mathrm{C}$-bus format. The in-lock detector bit FL is set to logic 1 when the loop is locked and is read on the SDA line (status byte) during a read operation. The ADC input is available for digital Automatic Frequency Control (AFC). The ADC code is read during a read operation on the ${ }^{2} \mathrm{C}$-bus (see Table 9). In test mode, pin ADC is used as a test output for $f_{\text {REF }}$ and $1 / 2 f_{\text {DIV }}$.

When the charge pump current switch mode is activated and the loop is phase-locked the charge pump current value is automatically switched to LOW. This is to improve carrier-to-noise ratio. The status of this feature can be read in the ACPS flag during a read operation on the $1^{2} \mathrm{C}$-bus (see Table 7).

Five serial bytes (including address byte) are required for the $\mathrm{I}^{2} \mathrm{C}$-bus format to address the devices, select the VCO frequency, program the three PNP ports, set the charge pump current and to set the reference divider ratio. The devices have four independent $\mathrm{I}^{2} \mathrm{C}$-bus addresses which can be selected by applying a specific voltage on the AS input (see Table 4).

5 V mixer/oscillator-PLL synthesizers for

Fig. 2 Pin configuration for TDA6404.

## FUNCTIONAL DESCRIPTION

The devices are controlled via the $\mathrm{I}^{2} \mathrm{C}$-bus.
For programming, there is one module address (7 bits) and the $\mathrm{R} / \overline{\mathrm{W}}$ bit for selecting the read or write mode.

## Write mode

Data bytes can be sent to the devices after the address transmission (first byte) by setting the R/W bit to logic 0 . Four data bytes are needed to fully program the devices. The $\mathrm{I}^{2} \mathrm{C}$-bus transceiver has an auto-increment facility which permits the programming of the devices within one single transmission (address +4 data bytes).
The devices can also be partially programmed, providing that the first data byte following the address is divider byte 1 (DB1) or control byte (CB). The bits in the data bytes are defined in Tables 1 and 2.

Fig. 3 Pin configuration for TDA6405(A)

The first bit of the data byte transmitted indicates whether frequency data (first bit $=0$ ) or control and band switch data (first bit $=1$ ) will follow. Until an ${ }^{2} \mathrm{C}$-bus STOP condition is sent by the controller, additional data bytes can be entered without the need to re-address the devices. The frequency register is loaded after the 8th clock pulse of the second divider byte (DB2). The control register is loaded after the 8th clock pulse of the CB. The band switch register is loaded after the 8th clock pulse of the band switch byte (BB).

## I2C-bus address selection

The module address contains programmable address bits (MA1 and MA0) which offer the possibility of having several synthesizers (up to 4) in one system by applying a specific voltage on the AS input. The relationship between MA1 and MAO and the input voltage applied to the AS input is given in Table 4.

Table 3 Description of symbols used in Tables 1 and 2

| SYMBOL | DESCRIPTION |
| :---: | :---: |
| A | acknowledge |
| MA1 and MA0 | programmable address bits (see Table 4) |
| N14 to N0 | programmable divider bits; $\mathrm{N}=\mathrm{N} 14 \times 2^{14}+\mathrm{N} 13 \times 2^{13}+\ldots+\mathrm{N} 1 \times 2^{1}+\mathrm{N} 0$ |
| CHP | charge pump current bit: $\begin{aligned} & \mathrm{CHP}=0 ; \mathrm{I}_{\mathrm{CP}}=60 \mu \mathrm{~A} \\ & \mathrm{CHP}=1 ; \mathrm{I}_{\mathrm{CP}}=280 \mu \mathrm{~A} \text { (default) } \end{aligned}$ |
| T2, T1 and T0 | test bits (see Table 5) |
| RSA and RSB | reference divider ratio select bits (see Table 6) |
| OS | tuning amplifier control bit: <br> OS = 0; normal operation; tuning voltage is 'ON' <br> OS = 1 ; tuning voltage is 'OFF' (high-impedance) |
| UHF, VHFH and VHFL | PNP ports control bits: <br> bit $=0$; buffer n is 'OFF' (default) <br> bit $=1$; buffer $n$ is 'ON' |
| X | don't care bit: may be a logic 0 or a logic 1 |

| T2 | T1 | T0 | TEST MODES |
| :---: | :---: | :---: | :---: |
| 0 | 0 | 0 | automatic charge pump off |
| 0 | 0 | 1 | automatic charge pump on; note 1 |
| 0 | 1 | X | charge pump is 'OFF' |
| 1 | 1 | 0 | charge pump is sinking current |
| 1 | 1 | 1 | charge pump is sourcing current |
| 1 | 0 | 0 | $\mathrm{f}_{\text {REF }}$ is available on pin ADC; note 2 |
| 1 | 0 | 1 | $1 / 2 \mathrm{f}_{\text {DIV }}$ is available on pin ADC; note 2 |

## Notes

1. This is the default mode at Power-on reset.
2. The ADC input cannot be used when these test modes are active.

Table 6 Reference divider ratio select bits

| RSA | RSB | REFERENCE DIVIDER RATIO | FREQUENCY STEP (kHz) |
| :---: | :---: | :---: | :---: |
| $X$ | 0 | 640 | 6.25 |
| 0 | 1 | 1024 | 3.90625 |
| 1 | 1 | 512 | 7.8125 |

## Read mode

Data can be read from the devices by setting the $R / \bar{W}$ bit to logic 1 (see Tables 7 and 8). After the slave address has been recognized, the devices generate an acknowledge pulse and the first data byte (status byte) is transferred on the SDA line (MSB first). Data is valid on the SDA line during a HIGH-level of the SCL clock signal. A second data byte can be read from the devices if the processor generates an acknowledge on the SDA line (master acknowledge). End of transmission will occur if no master acknowledge occurs. The devices will then release the data line to allow the processor to generate a STOP condition. The POR flag is set to logic 1 at power-on. The flag is reset when an end-of-data is detected by the devices (end of a read sequence). Control of the loop is made possible with the in-lock flag FL which indicates when the loop is locked ( $F L=1$ ).

The ACPS flag is LOW when the automatic charge pump switch mode is 'ON' and the loop is locked. In other conditions, $\operatorname{ACPS}=1$. When ACPS $=0$, the charge pump current is forced to the LOW value.

A built-in ADC is available on ADC pin. This converter can be used to apply AFC information to the controller from the IF section of the television. The relationship between the bits A2, A1 and A0 is given in Table 9.

| 1 | 0 | 0 | $0.60 \mathrm{~V}_{\mathrm{CC}}$ to $1.00 \mathrm{~V}_{\mathrm{CC}}$ |
| 0 | 1 | 1 | $0.45 \mathrm{~V}_{\mathrm{CC}}$ to $0.60 \mathrm{~V}_{\mathrm{CC}}$ |
| 0 | 1 | 0 | $0.30 \mathrm{~V}_{\mathrm{CC}}$ to $0.45 \mathrm{~V}_{\mathrm{CC}}$ |
| 0 | 0 | 1 | $0.15 \mathrm{~V}_{\mathrm{CC}}$ to $0.30 \mathrm{~V}_{\mathrm{CC}}$ |
| 0 | 0 | 0 | 0 to $0.15 \mathrm{~V}_{\mathrm{CC}}$ |

## Note

1. Accuracy is $\pm 0.03 \mathrm{~V}_{\mathrm{Cc}}$.

## Power-on reset

The power-on detection threshold voltage $\mathrm{V}_{\mathrm{POR}}$ is set to $\mathrm{V}_{\mathrm{CC}}=2 \mathrm{~V}$ at room temperature. Below this threshold, the device is reset to the power-on state.
At power-on state, the charge pump current is set to $280 \mu \mathrm{~A}$, the tuning voltage output is disabled, the test bits T2, T1 and T0 are set to logic 001 (automatic charge pump switch 'ON') and RSB is set to logic 1.

PUHF is 'OFF', which means that the UHF oscillator and the UHF mixer are switched off. Consequently, the VHF oscillator and the VHF mixer are switched on. PVHFL and PVHFH are 'OFF', which means that the VHF tank circuit is working in the VHF I sub-band. The tuning amplifier is switched off until the first transmission. In that case, the tank circuit in VHF I is supplied with the maximum tuning voltage. The oscillator is therefore working at the end of the VHF I sub-band.

## Notes

1. This is the level of the RF signal ( $100 \%$ amplitude modulated with 11.89 kHz ) that causes a 750 Hz frequency deviation on the oscillator signal; it produces sidebands 30 dB below the level of the oscillator signal.
2. The frequency shift is defined as the change of the oscillator frequency when the supply voltage varies from $\mathrm{V}_{\mathrm{CC}}=5$ to $4.75 \mathrm{~V}(4.5 \mathrm{~V})$ or from $\mathrm{V}_{\mathrm{CC}}=5$ to $5.25 \mathrm{~V}(5.5 \mathrm{~V})$. The oscillator is free-running during this measurement.
3. The frequency drift is defined as the change of the oscillator frequency when the ambient temperature varies from $\mathrm{T}_{\mathrm{amb}}=25$ to $0^{\circ} \mathrm{C}$ or from $\mathrm{T}_{\mathrm{amb}}=25$ to $50^{\circ} \mathrm{C}$. The oscillator is free-running during this measurement.
4. The switching on drift is defined as the change of the oscillator frequency between 5 seconds and 15 minutes after switching on. The oscillator is free-running during this measurement.
5. The ripple susceptibility is measured for a 500 kHz ripple at the IF amplifier output using the measurement circuit; the level of the ripple signal is increased until a difference of 53.5 dB between the IF carrier set at $100 \mathrm{~dB} \mu \mathrm{~V}$ and the sideband components is reached.
6. This is the level of divider interferences close to the IF frequency. For example:

Ch S1: $\mathrm{f}_{\text {osc }}=144.15 \mathrm{MHz}$ and $1 / 4 \mathrm{f}_{\mathrm{osc}}=36.0375 \mathrm{MHz}$.
Ch S2: $f_{\text {osc }}=151.15 \mathrm{MHz}$ and $1 / 4 f_{\text {osc }}=37.7875 \mathrm{MHz}$.
Ch S14: $\mathrm{f}_{\text {osc }}=291.15 \mathrm{MHz}$ and $1 / 8 \mathrm{f}_{\text {osc }}=36.39375 \mathrm{MHz}$.
The VHF RF input must be left open (i.e. not connected to any load or cable).
The UHF RF inputs are connected to a hybrid.
7. Crystal oscillator interference means the 4 MHz sidebands caused by the crystal oscillator. The rejection should be $>60 \mathrm{~dB}$ for an IF output signal of $100 \mathrm{~dB} \mu \mathrm{~V}$.
8. The reference frequency rejection is the level of reference frequency sidebands related to the sound subcarrier. The rejection should be $>50 \mathrm{~dB}$ for an IF output signal of $100 \mathrm{~dB} \mu \mathrm{~V}, \mathrm{f}_{\mathrm{REF}}=7.8125 \mathrm{kHz}$.
9. Channel $x$ beat: picture carrier frequency ( 69.25 MHz ) and sound carrier frequency ( 74.75 MHz ) both at $80 \mathrm{~dB} \mu \mathrm{~V}$, $\mathrm{f}_{\text {osc }}$ at 108.15 MHz . The rejection of the interfering product RF picture carrier frequency + RF sound carrier frequency - $\mathrm{f}_{\text {osc }}$ at 35.85 MHz should be $>60 \mathrm{~dB}$.
10. Channel S02: picture carrier frequency is 76.25 MHz at $80 \mathrm{~dB} \mu \mathrm{~V}, \mathrm{f}_{\text {osc }}=115.15 \mathrm{MHz}$.

The rejection of $\mathrm{f}_{\mathrm{osc}}-2 \times \mathrm{f}_{\mathrm{IF}}=37.35 \mathrm{MHz}$ should be $>66 \mathrm{~dB}$.

## SOLDERING

## Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our "Data Handbook IC26; Integrated Circuit Packages" (document order number 9398652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering is not always suitable for surface mount ICs, or for printed-circuit boards with high population densities. In these situations reflow soldering is often used.

## Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several methods exist for reflowing; for example, infrared/convection heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 to $250^{\circ} \mathrm{C}$. The top-surface temperature of the packages should preferable be kept below $230^{\circ} \mathrm{C}$.

## Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
- larger than or equal to 1.27 mm , the footprint longitudinal axis is preferred to be parallel to the transport direction of the printed-circuit board;
- smaller than 1.27 mm , the footprint longitudinal axis must be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a $45^{\circ}$ angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time is 4 seconds at $250^{\circ} \mathrm{C}$.
A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

## Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage ( 24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to $300^{\circ} \mathrm{C}$.

When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and $320^{\circ} \mathrm{C}$.

## 5 V mixer/oscillator-PLL synthesizers for hyperband tuners

Suitability of surface mount IC packages for wave and reflow soldering methods

| PACKAGE | SOLDERING METHOD |  |
| :--- | :--- | :--- |
|  | WAVE | REFLOW ${ }^{(1)}$ |
| BGA, SQFP | not suitable | suitable |
| HLQFP, HSQFP, HSOP, HTSSOP, SMS | not suitable |  |
| PLCC $^{(3)}$, SO, SOJ | suitable | suitable |
| LQFP, QFP, TQFP | not recommended ${ }^{(3)(4)}$ | suitable |
| SSOP, TSSOP, VSO | not recommended ${ }^{(5)}$ | suitable |

## Notes

1. All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the "Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods".
2. These packages are not suitable for wave soldering as a solder joint between the printed-circuit board and heatsink (at bottom version) can not be achieved, and as solder may stick to the heatsink (on top version).
3. If wave soldering is considered, then the package must be placed at a $45^{\circ}$ angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
4. Wave soldering is only suitable for LQFP, TQFP and QFP packages with a pitch (e) equal to or larger than 0.8 mm ; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm .
5. Wave soldering is only suitable for SSOP and TSSOP packages with a pitch (e) equal to or larger than 0.65 mm ; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm .

## 5 V mixer/oscillator-PLL synthesizers for hyperband tuners

## DEFINITIONS

| Data sheet status |  |
| :--- | :--- |
| Objective specification | This data sheet contains target or goal specifications for product development. |
| Preliminary specification | This data sheet contains preliminary data; supplementary data may be published later. |
| Product specification | This data sheet contains final product specifications. |
| Limiting values | Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or <br> more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation <br> of the device at these or at any other conditions above those given in the Characteristics sections of the specification <br> is not implied. Exposure to limiting values for extended periods may affect device reliability. |

## Application information

Where application information is given, it is advisory and does not form part of the specification.

## LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

## PURCHASE OF PHILIPS I²C COMPONENTS

Purchase of Philips $I^{2} \mathrm{C}$ components conveys a license under the Philips' $\mathrm{I}^{2} \mathrm{C}$ patent to use the components in the $I^{2} \mathrm{C}$ system provided the system conforms to the $\mathrm{I}^{2} \mathrm{C}$ specification defined by Philips. This specification can be ordered using the code 939839340011.
