PHILIPS

8-bit high-speed analog-to-digital converter

TDF8704

FEATURES

- 8-bit resolution
- Sampling rate up to 50 MHz
- Extended temperature range (–40 to +85 °C)
- High signal-to-noise ratio over a large analog input frequency range (7.4 effective bits at 4.43 MHz full-scale input and at $f_{\text{clk}} = 50$ MHz)
- Binary 3-state TTL outputs
- Overflow/underflow 3-state TTL output
- TTL compatible digital inputs
- Low-level AC clock input signal allowed
- Stable internal reference voltage regulator included
- Power dissipation only 380 mW (typical)
- Low analog input capacitance, no buffer amplifier required
- No sample-and-hold circuit required.

APPLICATIONS

- General purpose high-speed analog-to-digital conversion for extended temperature applications
- Automotive
- RF, satellite and GPS (Global Positioning System)
- Medical
- General industrial
- Digital video (VCR, TV and satellite).

GENERAL DESCRIPTION

The TDF8704T is an 8-bit high-speed analog-to-digital converter (ADC) for general industrial applications. It converts the analog input signal into 8-bit binary-coded digital words at a maximum sampling rate of 50 MHz. All digital inputs and outputs are TTL compatible, although a low-level AC clock input signal is allowed.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
V_{CCA}	analog supply voltage		4.75	5.0	5.25	V
V_{CCD}	digital supply voltage		4.75	5.0	5.25	V
V_{CCO}	output stages supply voltage		4.75	5.0	5.25	V
I_{CCA}	analog supply current		–	37	46	mA
I_{CCD}	digital supply current		–	23	35	mA
I_{CCO}	output stages supply current		–	16	21	mA
ILE	DC integral linearity error		–	±0.4	±1	LSB
DLE	DC differential linearity error		–	±0.2	±0.5	LSB
AILE	AC integral linearity error	note 1	–	–	±2	LSB
$f_{\text{clk(max)}}$	maximum clock frequency		50	–	–	MHz
P_{tot}	total power dissipation		–	380	535	mW

Note

1. Full-scale sine wave ($f_i = 4.43$ MHz; $f_{\text{clk}} = 50$ MHz).

PINNING

SYMBOL	PIN	DESCRIPTION
D1	1	data output; bit 1
D0	2	data output; bit 0 (LSB)
n.c.	3	not connected
V _{RB}	4	reference voltage BOTTOM (decoupling)
DEC	5	decoupling input (internal stabilization loop decoupling)
AGND	6	analog ground
V _{CCA}	7	analog supply voltage (+5 V)
V _I	8	analog input voltage
V _{RT}	9	reference voltage TOP (decoupling)
n.c.	10	not connected
O/UF	11	overflow/underflow data output
D7	12	data output; bit 7 (MSB)
D6	13	data output; bit 6
D5	14	data output; bit 5
D4	15	data output; bit 4
CLK	16	clock input
DGND	17	digital ground
V _{CCD}	18	digital supply voltage (+5 V)
V _{CCO1}	19	supply voltage for output stages 1 (+5 V)
OGND	20	output ground
V _{CCO2}	21	supply voltage for output stages 2 (+5 V)
\overline{CE}	22	chip enable input (TTL level input, active LOW)
D3	23	data output; bit 3
D2	24	data output; bit 2

LIMITING VALUES

In accordance with the Absolute Maximum Rating System (IEC134).

SYMBOL	PARAMETER	CONDITIONS	MIN.	MAX.	UNIT
V_{CCA}	analog supply voltage		-0.3	+7.0	V
V_{CCD}	digital supply voltage		-0.3	+7.0	V
V_{CCO}	output stages supply voltage		-0.3	+7.0	V
ΔV_{CC}	supply voltage differences between V_{CCA} and V_{CCD}		-1.0	+1.0	V
ΔV_{CC}	supply voltage differences between V_{CCO} and V_{CCD}		-1.0	+1.0	V
ΔV_{CC}	supply voltage differences between V_{CCA} and V_{CCO}		-1.0	+1.0	V
V_I	input voltage	referenced to AGND	-0.3	+7.0	V
$V_{clk(p-p)}$	AC input voltage for switching (peak-to-peak value)	referenced to DGND	-	V_{CCD}	V
I_o	output current		-	10	mA
T_{stg}	storage temperature		-55	+150	°C
T_{amb}	operating ambient temperature		-40	+85	°C
T_j	junction temperature		-	+150	°C

HANDLING

Inputs and outputs are protected against electrostatic discharges in normal handling. However, to be totally safe, it is desirable to take normal precautions appropriate to handling integrated circuits.

THERMAL CHARACTERISTICS

SYMBOL	PARAMETER	VALUE	UNIT
$R_{th\ j-a}$	thermal resistance from junction to ambient in free air	75	K/W

8-bit high-speed analog-to-digital converter

TDF8704

CHARACTERISTICS (see Tables 1 and 2)

$V_{CCA} = V_7$ to $V_6 = 4.75$ to 5.25 V; $V_{CCD} = V_{18}$ to $V_{17} = 4.75$ to 5.25 V; $V_{CCO} = V_{19}$ and V_{21} to $V_{20} = 4.75$ to 5.25 V; AGND and DGND shorted together; V_{CCA} to $V_{CCD} = -0.25$ to $+0.25$ V; V_{CCO} to $V_{CCD} = -0.25$ to $+0.25$ V;

V_{CCA} to $V_{CCD} = -0.25$ to $+0.25$ V; $T_{amb} = -40$ to $+85$ °C; typical readings taken at $V_{CCA} = V_{CCD} = 5$ V and $T_{amb} = 25$ °C; unless otherwise specified.

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
Supply						
V_{CCA}	analog supply voltage		4.75	5.0	5.25	V
V_{CCD}	digital supply voltage		4.75	5.0	5.25	V
V_{CCO}	output stages supply voltage		4.75	5.0	5.25	V
I_{CCA}	analog supply current		–	37	46	mA

t_{dHZ}	disable HIGH		–	50	54	ns
t_{dLZ}	disable LOW		–	10	14	ns

Notes

1. In addition to a good layout of the digital and analog ground, it is recommended that the rise and fall times of the clock must be less than 1 ns.
2. Full-scale sine wave ($f_i = 4.43$ MHz; $f_{clk} = 50$ MHz).
3. Determined by beat frequency method on a reconstructed sine wave signal for no missing codes and no glitches.
4. The analog input settling time is the minimum time required for the input signal to be stabilized after a sharp full-scale input (square-wave signal) in order to sample the signal and obtain correct output data.
5. Effective bits are obtained via a Fast Fourier Transform (FFT) treatment taking 4K acquisition points per period. The calculation takes into account all harmonics and noise up to half of the clock frequency (NYQUIST frequency). Conversion to signal-to-noise ratio: $S/N = EB \times 6.02 + 1.76$ dB.
6. Intermodulation measured relative to either tone with analog input frequencies of 4.43 MHz and 4.53 MHz. The two input signals have the same amplitude and the total amplitude of both signals provides full scale to the converter.
7. Measurement taken using video analyser VM700A.
8. Output data acquisition: the output data is available after the maximum delay time of t_d .

APPLICATION INFORMATION

The analog and digital supplies should be separated and decoupled.
 (1) V_{RB} and V_{RT} are decoupling pins for the internal reference ladder; do not draw current from these pins in order to achieve good linearity.
 (2) Pins 3 and 10 should be connected to DGND in order to prevent noise influence.

Fig.17 Application diagram.

PACKAGE OUTLINE

8-bit high-speed analog-to-digital converter

TDF8704

SOLDERING**Plastic small-outline packages**

BY WAVE

During placement and before soldering, the component must be fixed with a droplet of adhesive. After curing the adhesive, the component can be soldered. The adhesive can be applied by screen printing, pin transfer or syringe dispensing.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder bath is 10 s, if allowed to cool to less than 150 °C within 6 s. Typical dwell time is 4 s at 250 °C.

A modified wave soldering technique is recommended using two solder waves (dual-wave), in which a turbulent wave with high upward pressure is followed by a smooth laminar wave. Using a mildly-activated flux eliminates the need for removal of corrosive residues in most applications.

BY SOLDER PASTE REFLOW

Reflow soldering requires the solder paste (a suspension of fine solder particles, flux and binding agent) to be

applied to the substrate by screen printing, stencilling or pressure-syringe dispensing before device placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt, infrared, and vapour-phase reflow. Dwell times vary between 50 and 300 s according to method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 min at 45 °C.

REPAIRING SOLDERED JOINTS (BY HAND-HELD SOLDERING IRON OR PULSE-HEATED SOLDER TOOL)

Fix the component by first soldering two, diagonally opposite, end pins. Apply the heating tool to the flat part of the pin only. Contact time must be limited to 10 s at up to 300 °C. When using proper tools, all other pins can be soldered in one operation within 2 to 5 s at between 270 and 320 °C. (Pulse-heated soldering is not recommended for SO packages.)

For pulse-heated solder tool (resistance) soldering of VSO packages, solder is applied to the substrate by dipping or by an extra thick tin/lead plating before package placement.

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
