DESCRIPTION

Dedicated devices for ISDN interface and high speed data telecom line protection. Equivalent to a triple TRISIL with low capacitance.

These devices provide :

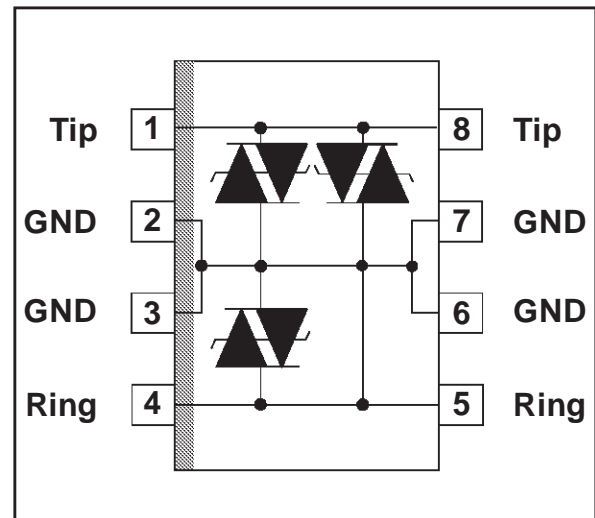

- low capacitance from lines to ground, allowing high speed transmission without signal attenuation.
- good capacitance balance between lines in order to ensure longitudinal balance.
- fixed breakdown voltage in both common and differential modes.
- the same surge current capability in both common and differential modes.
- A particular attention has been given to the internal wire bonding. The "4-point" configuration ensures a reliable protection, eliminating overvoltages introduced by the parasitic inductances of the wiring (Ldi/dt), especially for very fast transient overvoltages.

COMPLIES WITH THE FOLLOWING STANDARDS :

CCITT K17 - K20	10/700 μs	1.5 kV
	5/310 μs	38 A
VDE 0433	10/700 μs	2 kV

REFERENCE TEST CIRCUIT 1 :

FUNCTIONAL HOLDING CURRENT (I_H) TEST CIRCUIT 2 :

This is a GO-NOGO Test which allows to confirm the holding current (I_H) level in a functional test circuit.

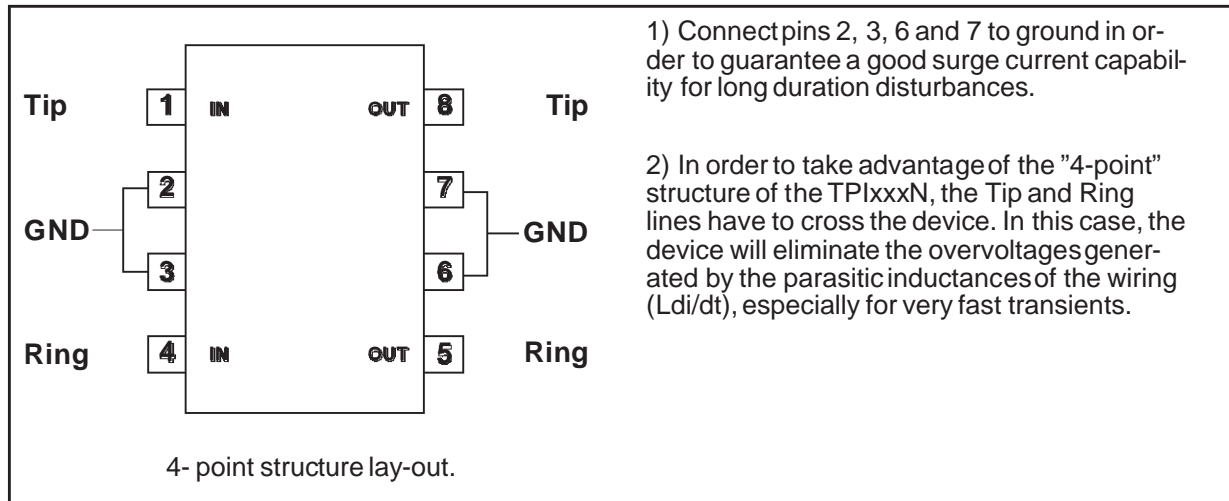

TEST PROCEDURE :

- 1) Adjust the current level at the I_H value by short circuiting the AK of the D.U.T.
- 2) Fire the D.U.T with a surge Current : $I_{pp} = 10\text{A}$, $10/1000 \mu\text{s}$.
- 3) The D.U.T will come back off-state within 50 ms max.

APPLICATION NOTE.

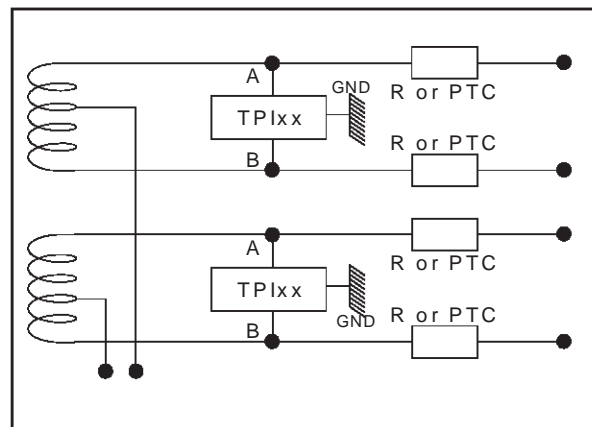

APPLICATION CIRCUITS :

1 - U INTERFACE PROTECTION

2 - S INTERFACE PROTECTION

This component uses an internal structure resulting in symmetrical characteristics with a good balanced behaviour. Its topology ensures the same breakdown voltage level for positive and negative surges in differential and common mode.
