

HIGH VOLTAGE IGNITION COIL DRIVER POWER IC

TYPE	V _{ci}	I _{ci}	I _d
VB025SP	380 V	9 A	100 mA

- PRIMARY COIL VOLTAGE INTERNALLY SET
- COIL CURRENT LIMIT INTERNALLY SET
- LOGIC LEVEL COMPATIBLE INPUT
- DRIVING CURRENT QUASI PROPORTIONAL TO COLLECTOR CURRENT
- SINGLE FLAG-ON COIL CURRENT

DESCRIPTION

The VB025SP is a high voltage power integrated circuit made using SGS-THOMSON Microelectronics Vertical Intelligent Power Technology, with vertical current flow power darlington and logic level compatible driving circuit.

Built-in protection circuits for coil current limiting and collector voltage clamping allows the VB025SP to be used as a smart, high voltage, high current interface in advanced electronic ignition systems.

$I_{diag(leak)}$	Leakage Current On Flag Output	$V_{in} = LOW$ $V_{CC} = 5.5V$			10	μA
V_F	Antiparallel Diode Forward Voltage	$I_c = -1 A$			2	V
$E_{s/b}$	Single Pulse Avalanche Energy	$L = 6 mH$ $I_C = 8 A$ (see figure 4)	180			mJ
t_{pHL}	Turn-on Delay Time of Coil Current	$R_c = 0.5 \Omega$ $L_c = 3.75 mH$ (see figure 5)		TBD		μs
t_{pLH}	Turn-off Delay Time of Coil Current	$R_c = 0.5 \Omega$ $L_c = 3.75 mH$ $I_c = 6.5 A$ (see figure 5)		TBD		μs

Note 1: Parametric degradation are allowed with $5.3 < V_b < 10V$ and $V_b > 24V$.

Note 2: The primary coil current value I_{di} must be measured 1ms after desaturation of the power stage.

Note 3: No Internal Pull-Down

(*) Internally limited

PRINCIPLE OF OPERATION

The VB025SP is mainly intended as a high voltage power switch device driven by a logic level input and interfaces directly to a high energy electronic ignition coil.

The input V_{in} of the VB025SP is fed from a low power signal generated by an external controller that determines both dwell time and ignition point. During V_{in} high ($\geq 4V$) the VB025SP increases current in the coil to the desired, internally set current level.

After reaching this level, the coil current remains constant until the ignition point, that corresponds to the transition of V_{in} from high to low (typ. 1.9V threshold).

During the coil current switch-off, the primary

voltage HV_c is clamped at an internally set value V_{cl} , typically 380V.

The transition from saturation to desaturation, coil current limiting phase, must have the ability to accommodate an overvoltage. A maximum overshoot of 20V is allowed.

FEEDBACK

When the collector current exceeds 4.5A, the feedback signal is turned high and it remains so, until the input voltage is turned-off.

OVERVOLTAGE

The VB025SP can withstand the following transients of the battery line:

- 100V/2msec ($R_i = 10 \Omega$)
- +100V/0.2msec ($R_i = 10 \Omega$)
- +50V/400msec ($R_i = 4.2 \Omega$, with $V_{IN} = 3 V$)
